This is the Cypher manual for Neo4j version 4.3, authored by the Neo4j Team.

This manual covers the following areas:

- **Introduction** — Introducing the Cypher query language.
- **Syntax** — Learn Cypher query syntax.
- **Clauses** — Reference of Cypher query clauses.
- **Functions** — Reference of Cypher query functions.
- **Indexes for search performance** — How to manage indexes used for search performance.
- **Full-text search index** — How to use full-text indexes, to enable full-text search.
- **Constraints** — How to manage constraints used for ensuring data integrity.
- **Database management** — How to use Cypher to manage Neo4j databases.
- **Access control** — How to manage Neo4j role-based access control and fine-grained security.
- **Query tuning** — Learn to analyze queries and tune them for performance.
- **Execution plans** — Cypher execution plans and operators.
- **Deprecations, additions and compatibility** — An overview of language developments across versions.
- **Glossary of keywords** — A glossary of Cypher keywords, with links to other parts of the Cypher manual.
- **Cypher styleguide** — A guide to the recommended style for writing Cypher queries.

Who should read this?

This manual is written for the developer of a Neo4j client application.
1.1. What is Cypher?

Cypher is a declarative graph query language that allows for expressive and efficient querying, updating and administering of the graph. It is designed to be suitable for both developers and operations professionals. Cypher is designed to be simple, yet powerful; highly complicated database queries can be easily expressed, enabling you to focus on your domain, instead of getting lost in database access.

Cypher is inspired by a number of different approaches and builds on established practices for expressive querying. Many of the keywords, such as WHERE and ORDER BY, are inspired by SQL. Pattern matching borrows expression approaches from SPARQL. Some of the list semantics are borrowed from languages such as Haskell and Python. Cypher’s constructs, based on English prose and neat iconography, make queries easy, both to write and to read.

Structure

Cypher borrows its structure from SQL — queries are built up using various clauses.

Clauses are chained together, and they feed intermediate result sets between each other. For example, the matching variables from one MATCH clause will be the context that the next clause exists in.

The query language is comprised of several distinct clauses. These are discussed in more detail in the chapter on Clauses.

The following are a few examples of clauses used to read from the graph:

- **MATCH**: The graph pattern to match. This is the most common way to get data from the graph.
- **WHERE**: Not a clause in its own right, but rather part of MATCH, OPTIONAL MATCH and WITH. Adds constraints to a pattern, or filters the intermediate result passing through WITH.
- **RETURN**: What to return.

Let’s see MATCH and RETURN in action.

Let’s create a simple example graph with the following query:

```
CREATE (john:Person {name: 'John'})
CREATE (joe:Person {name: 'Joe'})
CREATE (steve:Person {name: 'Steve'})
CREATE (sara:Person {name: 'Sara'})
CREATE (maria:Person {name: 'Maria'})
CREATE (john)-[:FRIEND]->(joe)-[:FRIEND]->(steve)
CREATE (john)-[:FRIEND]->(sara)-[:FRIEND]->(maria)
```
Example Graph

For example, here is a query which finds a user called 'John' and 'John's' friends (though not his direct friends) before returning both 'John' and any friends-of-friends that are found.

```
MATCH (john {name: 'John'})-[:FRIEND]->()[:FRIEND]->(fof)
RETURN john.name, fof.name
```

Resulting in:

<table>
<thead>
<tr>
<th>john.name</th>
<th>fof.name</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;John&quot;</td>
<td>&quot;Maria&quot;</td>
</tr>
<tr>
<td>&quot;John&quot;</td>
<td>&quot;Steve&quot;</td>
</tr>
<tr>
<td>2 rows</td>
<td></td>
</tr>
</tbody>
</table>

Next up we will add filtering to set more parts in motion:

We take a list of user names and find all nodes with names from this list, match their friends and return only those followed users who have a 'name' property starting with 'S'.

```
MATCH (user)-[:FRIEND]->(follower)
WHERE user.name IN ['Joe', 'John', 'Sara', 'Maria', 'Steve'] AND follower.name =~ 'S.*'
RETURN user.name, follower.name
```

Resulting in:

<table>
<thead>
<tr>
<th>user.name</th>
<th>follower.name</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;John&quot;</td>
<td>&quot;Sara&quot;</td>
</tr>
<tr>
<td>&quot;Joe&quot;</td>
<td>&quot;Steve&quot;</td>
</tr>
<tr>
<td>2 rows</td>
<td></td>
</tr>
</tbody>
</table>

And these are examples of clauses that are used to update the graph:

- **CREATE** (and **DELETE**): Create (and delete) nodes and relationships.
- **SET** (and **REMOVE**): Set values to properties and add labels on nodes using **SET** and use **REMOVE** to remove them.
• **MERGE**: Match existing or create new nodes and patterns. This is especially useful together with unique constraints.

1.2. Neo4j databases and graphs

This section describes databases and graphs in Neo4j.

Cypher queries are executed against a Neo4j database, but normally apply to specific graphs. It is important to understand the meaning of these terms and exactly when a graph is not a database.

**DBMS**

A Neo4j Database Management System is capable of containing and managing multiple graphs contained in databases. Client applications will connect to the DBMS and open sessions against it. A client session provides access to any graph in the DBMS.

**Graph**

This is a data model within a database. Normally there is only one graph within each database, and many administrative commands that refer to a specific graph do so using the database name.

Cypher queries executed in a session may declare which graph they apply to, or use a default, given by the session.

In Neo4j Fabric it is possible to refer to multiple graphs within the same query.

**Database**

A database is a storage and retrieval mechanism for collecting data in a defined space on disk and in memory.

Most of the time Cypher queries are reading or updating queries, which are run against a graph. There are also administrative commands that apply to a database, or to the entire DBMS. Administrative commands cannot be run in a session connected to a normal user database, but instead need to be run within a session connected to the system database.

1.2.1. The system database and the default database

All Neo4j servers contain a built-in database called **system**, which behaves differently than all other databases. The **system** database stores system data and you can not perform graph queries against it.

A fresh installation of Neo4j includes two databases:

- **system** - the system database described above, containing meta-data on the DBMS and security configuration.
- **neo4j** - the default database, named using the config option `dbms.default_database=neo4j`.

For more information about the system database, see the sections on Database management and Access control.
1.2.2. Different editions of Neo4j

Neo4j has two editions, a commercial Enterprise Edition with additional performance and administrative features, and an open-source Community Edition. Cypher works almost identically between the two editions, and as such most of this manual will not differentiate between them. In the few cases where there is a difference in Cypher language support or behaviour between editions, these are highlighted as described below in Limited Support Features.

However it is worth listing up-front the key areas that are not supported in the open-source edition:

<table>
<thead>
<tr>
<th>Feature</th>
<th>Enterprise</th>
<th>Community</th>
</tr>
</thead>
<tbody>
<tr>
<td>Multi-database</td>
<td>Any number of user databases</td>
<td>Only system and one user database</td>
</tr>
<tr>
<td>Role-based security</td>
<td>User, role, and privilege management for flexible access control and sub-graph access control.</td>
<td>Multi-user management. All users have full access rights.</td>
</tr>
<tr>
<td>Constraints</td>
<td>Existence constraints and multi-property NODE KEY constraints.</td>
<td>Only single property uniqueness constraints</td>
</tr>
</tbody>
</table>

1.2.3. Limited Support Features

Some elements of Cypher do not work in all deployments of Neo4j, and we use specific markers to highlight these cases:

<table>
<thead>
<tr>
<th>Marker</th>
<th>Description</th>
<th>Example</th>
</tr>
</thead>
<tbody>
<tr>
<td>deprecated</td>
<td>This feature is deprecated and will be removed in a future version</td>
<td>DROP INDEX ON :Label(property)</td>
</tr>
<tr>
<td>enterprise-only</td>
<td>This feature only works in the enterprise edition of Neo4j</td>
<td>CREATE DATABASE foo</td>
</tr>
<tr>
<td>fabric</td>
<td>This feature only works in a fabric deployment of Neo4j.</td>
<td>USE fabric.graph(0)</td>
</tr>
</tbody>
</table>

1.3. Querying, updating and administering

This section describes using Cypher for both querying and updating your graph, as well as administering graphs and databases.

In the introduction we described the common case of using Cypher to perform read-only queries of the graph. However, it is also possible to use Cypher to perform updates to the graph, import data into the graph, and perform administrative actions on graphs, databases and the entire DBMS.

All these various options are described in more detail in later sections, but it is worth summarizing a few key points first.
1.3.1. The structure of administrative queries

Cypher administrative queries cannot be combined with normal reading and writing queries. Each administrative query will perform either an update action to the system or a read of status information from the system. Some administrative commands make changes to a specific database, and will therefore be possible to run only when connected to the database of interest. Others make changes to the state of the entire DBMS and can only be run against the special system database.

1.3.2. The structure of update queries

If you read from the graph and then update the graph, your query implicitly has two parts — the reading is the first part, and the writing is the second part.

A Cypher query part can either read and match on the graph, or make updates on it, not both simultaneously.

If your query only performs reads, Cypher will not actually match the pattern until you ask for the results. In an updating query, the semantics are that all the reading will be done before any writing is performed.

The only pattern where the query parts are implicit is when you first read and then write — any other order and you have to be explicit about your query parts. The parts are separated using the WITH statement. WITH is like an event horizon — it’s a barrier between a plan and the finished execution of that plan.

When you want to filter using aggregated data, you have to chain together two reading query parts — the first one does the aggregating, and the second filters on the results coming from the first one.

```
MATCH (n {name: 'John'})-[[:FRIEND]-(friend)
WITH n, count(friend) AS friendsCount
WHERE friendsCount > 3
RETURN n, friendsCount
```

Using WITH, you specify how you want the aggregation to happen, and that the aggregation has to be finished before Cypher can start filtering.

Here’s an example of updating the graph, writing the aggregated data to the graph:

```
MATCH (n {name: 'John'})-[[:FRIEND]-(friend)
WITH n, count(friend) AS friendsCount
SET n.friendsCount = friendsCount
RETURN n.friendsCount
```

You can chain together as many query parts as the available memory permits.

1.3.3. Returning data

Any query can return data. If a query only reads, it has to return data. If a read-query doesn’t return any data, it serves no purpose, and is therefore not a valid Cypher query. Queries that update the graph don’t have to return anything, but they can.

After all the parts of the query comes one final RETURN clause. RETURN is not part of any query part — it is a
period symbol at the end of a query. The `RETURN` clause has three sub-clauses that come with it: `SKIP/LIMIT` and `ORDER BY`.

If you return nodes or relationships from a query that has just deleted them — beware, you are holding a pointer that is no longer valid.

1.4. Transactions

This section describes how Cypher queries work with database transactions.

All Cypher statements are explicitly run within a transaction. For read-only queries, the transaction will always succeed. For updating queries it is possible that a failure can occur for some reason, for example if the query attempts to violate a constraint, in which case the entire transaction is rolled back, and no changes are made to the graph. Every statement is executed within the context of the transaction, and nothing will be persisted to disk until that transaction is successfully committed.

In short, an updating query will always either fully succeed, or not succeed at all.

While it is not possible to run a Cypher query outside a transaction, it is possible to run multiple queries within a single transaction using the following sequence of operations:

1. Open a transaction,
2. Run multiple updating Cypher queries.
3. Commit all of them in one go.

Note that the transaction will hold the changes in memory until the whole query, or whole set of queries, has finished executing. A query that makes a large number of updates will consequently use large amounts of memory. For memory configuration in Neo4j, see the Neo4j Operations Manual → Memory configuration.

For examples of the API’s used to start and commit transactions, refer to the API specific documentation:

- For information on using transactions with a Neo4j driver, see The session API in the Neo4j Driver manuals.
- For information on using transactions over the HTTP API, see the HTTP API documentation → Using the HTTP API.
- For information on using transactions within the embedded Core API, see the Java Reference → Executing Cypher queries from Java.

When writing procedures or using Neo4j embedded, remember that all iterators returned from an execution result should be either fully exhausted or closed. This ensures that the resources bound to them are properly released.

1.4.1. DBMS Transactions

Beginning a transaction while connected to a DBMS will start a DBMS-level transaction. A DBMS-level transaction is a container for database transactions.
A database transaction is started when the first query to a specific database is issued. Database transactions opened inside a DBMS-level transaction are committed or rolled back when the DBMS-level transaction is committed or rolled back.

For an example of how queries to multiple databases can be issued in one transaction, see Databases and execution context in the Neo4j Driver manuals.

DBMS transactions have the following limitations:

- Only one database can be written to in a DBMS transaction
- Cypher operations fall into the following main categories:
  - Operations on graphs.
  - Schema commands.
  - Administration commands.

It is not possible to combine any of these workloads in a single DBMS transaction.

1.5. Cypher path matching

Cypher path matching uses relationship isomorphism, the same relationship cannot be returned more than once in the same result record.

Neo4j Cypher makes use of relationship isomorphism for path matching and is a very effective way of reducing the result set size and preventing infinite traversals.

| Info | In Neo4j, all relationships have a direction. However, you can have the notion of undirected relationships at query time. |

In the case of variable length pattern expressions, it is particularly important to have a constraint check, or an infinite number of result records could be found.

To understand this better, let us consider a few alternative options:

Homomorphism
- No constraints for path matching.

Node isomorphism
- The same node cannot be returned more than once for each path matching record.

Relationship isomorphism
- The same relationship cannot be returned more than once for each path matching record. Cypher makes use of relationship isomorphism for path matching.
1.5.1. Homomorphism

**Constraints:** No constraints for path matching.

**Example 1. Homomorphism**

The graph is composed of only two nodes \((a)\) and \((b)\), connected by one relationship, \((a:Node)\)-\([r:R]\)->(b:Node)\).

If the query is looking for paths of length \(n\) and do not care about the direction, a path of length \(n\) will be returned repeating the two nodes over and over.

For example, find all paths with 5 relationships and do not care about the relationship direction:

```sql
MATCH p = ()-[r:R*5]-()
RETURN nodes(p)
```

This will return the two resulting records if homomorphism was used, \([a,b,a,b,a,b]\) as well as \([b,a,b,a,b,a]\).

1.5.2. Node isomorphism

**Constraints:** The same node cannot be returned more than once for each path matching record.

In another two-node example, such as \((a:Node)\)-\([r:R]\)->(b:Node)\); only paths of length 1 can be found with the node isomorphism constraint.

**Example 2. Node isomorphism**

The graph is composed of only two nodes \((a)\) and \((b)\), connected by one relationship, \((a:Node)\)-\([r:R]\)->(b:Node)\).

```sql
MATCH p = ()-[r:R+1]-()
RETURN nodes(p)
```

This will return the two resulting records if node isomorphism was used, \([a, b]\), as well as \([b, a]\).

1.5.3. Relationship isomorphism

**Constraints:** The same relationship cannot be returned more than once for each path matching record.

In another two-node example, such as \((a:Node)\)-\([r:R]\)->(b:Node)\); only paths of length 1 can be found with the relationship isomorphism constraint.
Example 3. Relationship isomorphism

The graph is composed of only two nodes (a) and (b), connected by one relationship, (a:Node)-[r:R]->(b:Node).

```cypher
MATCH p = ()-[+1]-()
RETURN nodes(p)
```

This will return the two resulting records [a, b], as well as [b, a].

1.5.4. Cypher path matching example

Cypher makes use of relationship isomorphism for path matching.
Example 4. Friend of friends

Looking for a user’s friends of friends should not return said user.

To demonstrate this, let’s create a few nodes and relationships:

Query 1, create data.

```
CREATE
    (adam:User {name: 'Adam'}),
    (pernilla:User {name: 'Pernilla'}),
    (david:User {name: 'David'}),
    (adam)-[:FRIEND]->(pernilla),
    (pernilla)-[:FRIEND]->(david)
```

Nodes created: 3
Relationships created: 2
Properties set: 3

Which gives us the following graph:

Now let’s look for friends of friends of Adam:

Query 2, friend of friends of Adam.

```
MATCH (user:User {name: 'Adam'})-[r1:FRIEND]-(u)-[r2:FRIEND]-(friend_of_a_friend)
RETURN friend_of_a_friend.name AS fofName
```

```
+---------+
<table>
<thead>
<tr>
<th>fofName</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;David&quot;</td>
</tr>
</tbody>
</table>
+---------+
Rows: 1
```

In this query, Cypher makes sure to not return matches where the pattern relationships $r1$ and $r2$ point to the same graph relationship.

This is however not always desired. If the query should return the user, it is possible to spread the matching over multiple `MATCH` clauses, like so:
Query 3, multiple MATCH clauses.

```plaintext
MATCH (user:User {name: 'Adam'})-[r1:FRIEND]-(:friend)
MATCH (:friend)-[r2:FRIEND]-(:friend_of_a_friend)
RETURN :friend_of_a_friend.name AS fofName
```

<table>
<thead>
<tr>
<th>fofName</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;David&quot;</td>
</tr>
<tr>
<td>&quot;Adam&quot;</td>
</tr>
</tbody>
</table>

Rows: 2

Note that while the following Query 4 looks similar to Query 3, it is actually equivalent to Query 2.

Query 4, equivalent to query 2.

```plaintext
MATCH (user:User {name: 'Adam'})-[r1:FRIEND]-(:friend),
    (:friend)-[r2:FRIEND]-(:friend_of_a_friend)
RETURN :friend_of_a_friend.name AS fofName
```

Here, the **MATCH** clause has a single pattern with two paths, while the previous query has two distinct patterns.

<table>
<thead>
<tr>
<th>fofName</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;David&quot;</td>
</tr>
</tbody>
</table>

  ◦ Examples
  ◦ Temporal indexing

• **Spatial values**
  ◦ Introduction
  ◦ Coordinate Reference Systems
    ▪ Geographic coordinate reference systems
    ▪ Cartesian coordinate reference systems
  ◦ Spatial instants
    ▪ Creating points
    ▪ Accessing components of points
  ◦ Spatial index

• **Lists**
  ◦ Lists in general
  ◦ List comprehension
2.1. Values and types

This section provides an overview of data types in Cypher.

Cypher provides first class support for a number of data types.

These fall into several categories which will be described in detail in the following subsections:

Property types

- Integer, Float, String, Boolean, Point, Date, Time, LocalTime, DateTime, LocalDateTime, and Duration.

Structural types

- Node, Relationship, and Path.

Composite types

- List and Map.

2.1.1. Property types

☑ Can be returned from Cypher queries
☑ Can be used as parameters
☑ Can be stored as properties
☑ Can be constructed with Cypher literals

The property types:

- **Number**, an abstract type, which has the subtypes Integer and Float
- String
- Boolean
- The spatial type Point
• Temporal types: Date, Time, LocalTime, DateTime, LocalDateTime and Duration

The adjective numeric, when used in the context of describing Cypher functions or expressions, indicates that any type of Number applies (Integer or Float).

Homogeneous lists of simple types can also be stored as properties, although lists in general (see Composite types) cannot be stored.

Cypher also provides pass-through support for byte arrays, which can be stored as property values. Byte arrays are not considered a first class data type by Cypher, so do not have a literal representation.

<table>
<thead>
<tr>
<th>i</th>
<th>Sorting of special characters</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Strings that contain characters that do not belong to the Basic Multilingual Plane (BMP) can have inconsistent or non-deterministic ordering in Neo4j. BMP is a subset of all characters defined in Unicode. Expressed simply, it contains all common characters from all common languages.</td>
</tr>
<tr>
<td></td>
<td>The most significant characters not in BMP are those belonging to the Supplementary Multilingual Plane or the Supplementary Ideographic Plane. Examples are:</td>
</tr>
<tr>
<td></td>
<td>• Historic scripts and symbols and notation used within certain fields such as: Egyptian hieroglyphs, modern musical notation, mathematical alphanumerics.</td>
</tr>
<tr>
<td></td>
<td>• Emojis and other pictographic sets.</td>
</tr>
<tr>
<td></td>
<td>• Game symbols for playing cards, Mah Jongg, and dominoes.</td>
</tr>
<tr>
<td></td>
<td>• CJK Ideograph that were not included in earlier character encoding standards.</td>
</tr>
</tbody>
</table>

2.1.2. Structural types

☑ Can be returned from Cypher queries
☐ Cannot be used as parameters
☐ Cannot be stored as properties
☐ Cannot be constructed with Cypher literals

The structural types:

• Node
  ° Id
  ° Label(s)

  | i | Labels are not values but are a form of pattern syntax. |

  ° Map (of properties)

• Relationship
  ° Id
• **Type**
  • Map (of properties)
  • Id of the start node
  • Id of the end node

• **Path**, an alternating sequence of nodes and relationships

Nodes, relationships, and paths are returned as a result of pattern matching. In Neo4j, all relationships have a direction. However, you can have the notion of undirected relationships at query time.

### 2.1.3. Composite types

- Can be returned from Cypher queries
- Can be used as *parameters*
- Cannot be stored as properties
- Can be constructed with *Cypher literals*

The composite types:

- **List**, a heterogeneous, ordered collection of values, each of which has any property, structural or composite type.
- **Map**, a heterogeneous, unordered collection of (Key, Value) pairs.
  - Key is a String
  - Value has any property, structural or composite type

Composite values can also contain null.

Special care must be taken when using null (see *Working with null*).

### 2.2. Naming rules and recommendations

This section describes rules and recommendations for the naming of node labels, relationship types, property names, variables, indexes, and constraints.

#### 2.2.1. Naming rules

- **Alphabetic characters**:
  - Names should begin with an alphabetic character.
  - This includes "non-English" characters, such as å, ä, ö, ü etc.
• Numbers:
  ◦ Names should not begin with a number.
  ◦ To illustrate, first1 is not allowed, whereas first1 is allowed.

• Symbols:
  ◦ Names should not contain symbols, except for underscore, as in my_variable, or $ as the first character to denote a parameter, as given by $myParam.

• Length:
  ◦ Can be very long, up to 65535 \(2^{16} - 1\) or 65534 characters, depending on the version of Neo4j.

• Case-sensitive:
  ◦ Names are case-sensitive and thus, :PERSON, :Person and :person are three different labels, and n and N are two different variables.

• Whitespace characters:
  ◦ Leading and trailing whitespace characters will be removed automatically. For example, MATCH (a) RETURN a is equivalent to MATCH (a) RETURN a.

2.2.2. Scoping and namespace rules

• Node labels, relationship types and property names may re-use names.
  ◦ The following query — with a for the label, type and property name — is valid: CREATE (a:a {a: 'a'})-[r:a]->(b:a {a: 'a'}). 

• Variables for nodes and relationships must not re-use names within the same query scope.
  ◦ The following query is not valid as the node and relationship both have the name a: CREATE (a)-[a]->(b).

2.2.3. Recommendations

Here are the recommended naming conventions:

<table>
<thead>
<tr>
<th>Node labels</th>
<th>Camel-case, beginning with an upper-case character</th>
<th>:VehicleOwner rather than :vehicle_owner etc.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Relationship types</td>
<td>Upper-case, using underscore to separate words</td>
<td>:OWNS_VEHICLE rather than :ownsVehicle etc.</td>
</tr>
</tbody>
</table>
2.3. Expressions

This section contains an overview of expressions in Cypher with examples.

- **Expressions in general**
- **Note on string literals**
- **CASE expressions**
  - Simple CASE form: comparing an expression against multiple values
  - Generic CASE form: allowing for multiple conditionals to be expressed
  - Distinguishing between when to use the simple and generic CASE forms

2.3.1. Expressions in general

| Note | Most expressions in Cypher evaluate to null if any of their inner expressions are null. Notable exceptions are the operators IS NULL and IS NOT NULL. |

An expression in Cypher can be:

- A decimal (integer or float) literal: 13, -40000, 3.14
- A decimal (integer or float) literal in scientific notation: 6.022E23.
- A hexadecimal integer literal (starting with 0x): 0x13af, 0xFC3A9, -0x66eff.
- An octal integer literal (starting with 0o or 0): 0o1372, 02127, -0o5671.
- A string literal: 'Hello', "World".
- A boolean literal: true, false.
- A variable: n, x, rel, myFancyVariable, 'A name with weird stuff in it[]!'.
- A property: n.prop, x.prop, rel.thisProperty, myFancyVariable. (weird property name).
- A dynamic property: n."prop", rel[n.city + n.zip], map[coll[0]].
- A parameter: $param, $0.
- A list of expressions: ["a", "b"], [1, 2, 3], ["a", 2, n.property, $param], [].
- A function call: length(p), nodes(p).
- An aggregate function: avg(x.prop), count(*)
- A path-pattern: (a)-[r]->(b), (a)-[r]-(b), (a)--(b), (a)-->()<--(b).
- An operator application: 1 + 2, 3 < 4.
- A predicate expression is an expression that returns true or false: a.prop = 'Hello', length(p) > 10, a.name IS NOT NULL.
- An existential subquery is an expression that returns true or false: EXISTS { MATCH (n)-[r]->(p) WHERE p.name = 'Sven' }.
- A regular expression: a.name =~ 'Tim.*'.
• A case-sensitive string matching expression: `a.surname STARTS WITH 'Sven', a.surname ENDS WITH 'son' or a.surname CONTAINS 'son'.`

• A `CASE` expression.

2.3.2. Note on string literals

String literals can contain the following escape sequences:

<table>
<thead>
<tr>
<th>Escape sequence</th>
<th>Character</th>
</tr>
</thead>
<tbody>
<tr>
<td>\t</td>
<td>Tab</td>
</tr>
<tr>
<td>\b</td>
<td>Backspace</td>
</tr>
<tr>
<td>\n</td>
<td>Newline</td>
</tr>
<tr>
<td>\r</td>
<td>Carriage return</td>
</tr>
<tr>
<td>\f</td>
<td>Form feed</td>
</tr>
<tr>
<td>'</td>
<td>Single quote</td>
</tr>
<tr>
<td>&quot;</td>
<td>Double quote</td>
</tr>
<tr>
<td>&quot;</td>
<td>Backslash</td>
</tr>
<tr>
<td>\uxxxxx</td>
<td>Unicode UTF-16 code point (4 hex digits must follow the \u)</td>
</tr>
<tr>
<td>\uxxxxxxxxx</td>
<td>Unicode UTF-32 code point (8 hex digits must follow the \U)</td>
</tr>
</tbody>
</table>

2.3.3. `CASE` expressions

Generic conditional expressions may be expressed using the `CASE` construct. Two variants of `CASE` exist within Cypher: the simple form, which allows an expression to be compared against multiple values, and the generic form, which allows multiple conditional statements to be expressed.

- CASE can only be used as part of RETURN or WITH if you want to use the result in the succeeding clause or statement.

The following graph is used for the examples below:
Graph

Simple CASE form: comparing an expression against multiple values

The expression is calculated, and compared in order with the WHEN clauses until a match is found. If no match is found, the expression in the ELSE clause is returned. However, if there is no ELSE case and no match is found, null will be returned.

Syntax:

```plaintext
CASE test
  WHEN value THEN result
  [WHEN ...]
  [ELSE default]
END
```

Arguments:

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>test</td>
<td>A valid expression.</td>
</tr>
<tr>
<td>value</td>
<td>An expression whose result will be compared to test.</td>
</tr>
<tr>
<td>result</td>
<td>This is the expression returned as output if value matches test.</td>
</tr>
<tr>
<td>default</td>
<td>If no match is found, default is returned.</td>
</tr>
</tbody>
</table>

Query

```plaintext
MATCH (n)
RETURN
CASE n.eyes
  WHEN 'blue' THEN 1
  WHEN 'brown' THEN 2
  ELSE 3
END AS result
```

Table 1. Result
Generic **CASE** form: allowing for multiple conditionals to be expressed

The predicates are evaluated in order until a `true` value is found, and the result value is used. If no match is found, the expression in the **ELSE** clause is returned. However, if there is no **ELSE** case and no match is found, **null** will be returned.

**Syntax:**

```sql
CASE
  WHEN predicate THEN result
  [WHEN ...]
  [ELSE default]
END
```

**Arguments:**

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>predicate</code></td>
<td>A predicate that is tested to find a valid alternative.</td>
</tr>
<tr>
<td><code>result</code></td>
<td>This is the expression returned as output if <code>predicate</code> evaluates to true.</td>
</tr>
<tr>
<td><code>default</code></td>
<td>If no match is found, <code>default</code> is returned.</td>
</tr>
</tbody>
</table>

**Query**

```sql
MATCH (n)
RETURN
CASE
  WHEN n.eyes = 'blue' THEN 1
  WHEN n.age < 40 THEN 2
  ELSE 3
END AS result
```

**Table 2. Result**

<table>
<thead>
<tr>
<th>result</th>
</tr>
</thead>
<tbody>
<tr>
<td>2</td>
</tr>
<tr>
<td>1</td>
</tr>
<tr>
<td>3</td>
</tr>
<tr>
<td>3</td>
</tr>
<tr>
<td>1</td>
</tr>
</tbody>
</table>
Distinguishing between when to use the simple and generic \texttt{CASE} forms

Owing to the close similarity between the syntax of the two forms, sometimes it may not be clear at the outset as to which form to use. We illustrate this scenario by means of the following query, in which there is an expectation that $age_{10\_years\_ago}$ is -1 if \texttt{n.age} is \texttt{null}:

\begin{verbatim}
MATCH (n)
RETURN n.name,
CASE n.age
    WHEN n.age IS NULL THEN -1
    ELSE n.age - 10
END AS age_{10\_years\_ago}
\end{verbatim}

However, as this query is written using the simple \texttt{CASE} form, instead of $age_{10\_years\_ago}$ being -1 for the node named Daniel, it is \texttt{null}. This is because a comparison is made between \texttt{n.age} and \texttt{n.age IS NULL}. As \texttt{n.age IS NULL} is a boolean value, and \texttt{n.age} is an integer value, the \texttt{WHEN n.age IS NULL THEN -1} branch is never taken. This results in the \texttt{ELSE n.age - 10} branch being taken instead, returning \texttt{null}.

\begin{table}[h]
\centering
\begin{tabular}{|l|l|}
\hline
\textbf{n.name} & \textbf{age\_10\_years\_ago} \\
\hline
"Alice" & 28 \\
"Bob" & 15 \\
"Charlie" & 43 \\
"Daniel" & \texttt{null} \\
"Eskil" & 31 \\
\hline
\end{tabular}
\caption{Result}
\end{table}

The corrected query, behaving as expected, is given by the following generic \texttt{CASE} form:

\begin{verbatim}
MATCH (n)
RETURN n.name,
CASE WHEN n.age IS NULL THEN -1
ELSE n.age - 10
END AS age_{10\_years\_ago}
\end{verbatim}

We now see that the $age_{10\_years\_ago}$ correctly returns -1 for the node named Daniel.

\begin{table}[h]
\centering
\begin{tabular}{|l|l|}
\hline
\textbf{n.name} & \textbf{age\_10\_years\_ago} \\
\hline
"Alice" & 28 \\
"Bob" & 15 \\
\hline
\end{tabular}
\caption{Result}
\end{table}
<table>
<thead>
<tr>
<th>n.name</th>
<th>age_10_years_ago</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;Charlie&quot;</td>
<td>43</td>
</tr>
<tr>
<td>&quot;Daniel&quot;</td>
<td>-1</td>
</tr>
<tr>
<td>&quot;Eskil&quot;</td>
<td>31</td>
</tr>
</tbody>
</table>

Rows: 5

Using the result of **CASE** in the succeeding clause or statement

You can use the result of **CASE** to set properties on a node or relationship. For example, instead of specifying the node directly, you can set a property for a node selected by an expression:

**Query**

```
MATCH (n)
WITH n,
CASE n.eyes
  WHEN 'blue' THEN 1
  WHEN 'brown' THEN 2
  ELSE 3
END AS colourCode
SET n.colourCode = colourCode
```

For more information about using the **SET** clause, see **SET**.

**Table 5. Result**

<table>
<thead>
<tr>
<th>(empty result)</th>
</tr>
</thead>
</table>

Rows: 0
Properties set: 5

### 2.4. Variables

*This section provides an overview of variables in Cypher.*

When you reference parts of a pattern or a query, you do so by naming them. The names you give the different parts are called variables.

In this example:

```
MATCH (n)-->(b)
RETURN b
```

The variables are **n** and **b**.

Information regarding the naming of variables may be found [here](#).
Variables are only visible in the same query part
Variables are not carried over to subsequent queries. If multiple query parts are chained together using `WITH`, variables have to be listed in the `WITH` clause to be carried over to the next part. For more information see `WITH`.

2.5. Reserved keywords

*This section contains a list of reserved keywords in Cypher.*

Reserved keywords are words that have a special meaning in Cypher. The listing of the reserved keywords are grouped by the categories from which they are drawn. In addition to this, there are a number of keywords that are reserved for future use.

The reserved keywords are not permitted to be used as identifiers in the following contexts:

- Variables
- Function names
- Parameters

If any reserved keyword is escaped — i.e. is encapsulated by backticks ``, such as `AND` — it would become a valid identifier in the above contexts.

2.5.1. Clauses

- `CALL`
- `CREATE`
- `DELETE`
- `DETACH`
- `EXISTS`
- `FOREACH`
- `LOAD`
- `MATCH`
- `MERGE`
- `OPTIONAL`
- `REMOVE`
- `RETURN`
- `SET`
- `START`
- `UNION`
- `UNWIND`
• WITH

2.5.2. Subclauses
• LIMIT
• ORDER
• SKIP
• WHERE
• YIELD

2.5.3. Modifiers
• ASC
• ASCENDING
• ASSERT
• BY
• CSV
• DESC
• DESCENDING
• ON

2.5.4. Expressions
• ALL
• CASE
• ELSE
• END
• THEN
• WHEN

2.5.5. Operators
• AND
• AS
• CONTAINS
• DISTINCT
• ENDS
• IN
• IS
• NOT
• OR
• STARTS
• XOR

2.5.6. Schema

• CONSTRAINT
• CREATE
• DROP
• EXISTS
• INDEX
• NODE
• KEY
• UNIQUE

2.5.7. Hints

• INDEX
• JOIN
• PERIODIC
• COMMIT
• SCAN
• USING

2.5.8. Literals

• false
• null
• true

2.5.9. Reserved for future use

• ADD
• DO
• FOR
• MANDATORY
• OF
• REQUIRE
2.6. Parameters

This section describes parameterized querying.

2.6.1. Introduction

Cypher supports querying with parameters. A parameterized query is a query in which placeholders are used for parameters and the parameter values are supplied at execution time. This means developers do not have to resort to string building to create a query. Additionally, parameters make caching of execution plans much easier for Cypher, thus leading to faster query execution times.

Parameters can be used for:

- literals and expressions
- node and relationship ids

Parameters cannot be used for the following constructs, as these form part of the query structure that is compiled into a query plan:

- property keys; so, MATCH (n) WHERE n.$param = 'something' is invalid
- relationship types
- labels

Parameters may consist of letters and numbers, and any combination of these, but cannot start with a number or a currency symbol.

Setting parameters when running a query is dependent on the client environment. For example:

- To set a parameter in Cypher Shell use :param name => 'Joe'. For more information refer to Operations Manual → Cypher Shell - Query Parameters.
- For Neo4j Browser use the same syntax as Cypher Shell, :param name => 'Joe'.
- When using drivers, the syntax is dependent on the language choice. See the examples in Transactions in the Neo4j Driver manuals.
- For usage via the Neo4j HTTP API, see the HTTP API documentation.

We provide below a comprehensive list of examples of parameter usage. In these examples, parameters are given in JSON; the exact manner in which they are to be submitted depends upon the driver being used.

The old parameter syntax (param) was deprecated in Neo4j 3.0 and removed entirely in Neo4j 4.0. Using it will result in a syntax error. However, it is still possible to use it, with warnings, if you prefix the query with CYPER 3.5. See Cypher Compatibility for further information.
2.6.2. Auto-parameterization

When a query does not use parameters, Cypher will try to infer parameters anyway. Each literal in the query is replaced with a parameter. This increases the re-usability of the computed plan for queries that are identical except for the literals. It is not recommended to rely on this behavior - users should rather use parameters where they think it is appropriate.

If at least one parameter is used in the query, auto-parameterization is turned off for that query. This means that any remaining literals will not be turned into parameters.

2.6.3. String literal

Parameters

```json
{
    "name" : "Johan"
}
```

Query

```cypher
MATCH (n:Person)
WHERE n.name = $name
RETURN n
```

You can use parameters in this syntax as well:

Parameters

```json
{
    "name" : "Johan"
}
```

Query

```cypher
MATCH (n:Person {name: $name})
RETURN n
```

2.6.4. Regular expression

Parameters

```json
{
    "regex" : ".*h.*"
}
```

Query

```cypher
MATCH (n:Person)
WHERE n.name =~ $regex
RETURN n.name
```
2.6.5. Case-sensitive string pattern matching

Parameters

```json
{
  "name" : "Michael"
}
```

Query

```sql
MATCH (n:Person)
WHERE n.name STARTS WITH $name
RETURN n.name
```

2.6.6. Create node with properties

Parameters

```json
{
  "props" : {
    "name" : "Andy",
    "position" : "Developer"
  }
}
```

Query

```sql
CREATE ($props)
```

2.6.7. Create multiple nodes with properties

Parameters

```json
{
  "props" : [
    {
      "awesome" : true,
      "name" : "Andy",
      "position" : "Developer"
    },
    {
      "children" : 3,
      "name" : "Michael",
      "position" : "Developer"
    }
  ]
}
```

Query

```sql
UNWIND $props AS properties
CREATE (n:Person)
SET n = properties
RETURN n
```

2.6.8. Setting all properties on a node

Note that this will replace all the current properties.
Parameters
{
  "props": {
    "name": "Andy",
    "position": "Developer"
  }
}

Query
MATCH (n:Person)
WHERE n.name = 'Michaela'
SET n = $props

2.6.9. SKIP and LIMIT

Parameters
{
  "s": 1,
  "l": 1
}

Query
MATCH (n:Person)
RETURN n.name
SKIP $s
LIMIT $l

2.6.10. Node id

Parameters
{
  "id": 0
}

Query
MATCH (n)
WHERE id(n) = $id
RETURN n.name

2.6.11. Multiple node ids

Parameters
{
  "ids": [0, 1, 2]
}
Query

```sql
MATCH (n)
WHERE id(n) IN $ids
RETURN n.name
```

2.6.12. Calling procedures

Parameters

```json
{
   "indexname" : "My index"
}
```

Query

```sql
CALL db.resampleIndex($indexname)
```

2.7. Operators

This section contains an overview of operators.

- Operators at a glance
- Aggregation operators
  - Using the DISTINCT operator
- Property operators
  - Statically accessing a property of a node or relationship using the . operator
  - Filtering on a dynamically-computed property key using the [\ operator]
  - Replacing all properties of a node or relationship using the = operator
  - Mutating specific properties of a node or relationship using the += operator
- Mathematical operators
  - Using the exponentiation operator ^
  - Using the unary minus operator -
- Comparison operators
  - Comparing two numbers
  - Using STARTS WITH to filter names
  - Equality and comparison of values
  - Ordering and comparison of values
  - Chaining comparison operations
  - Using a regular expression with =~ to filter words
- Boolean operators
• Using boolean operators to filter numbers

• String operators
  ◦ Concatenating two strings using +

• Temporal operators
  ◦ Adding and subtracting a Duration to or from a temporal instant
  ◦ Adding and subtracting a Duration to or from another Duration
  ◦ Multiplying and dividing a Duration with or by a number

• Map operators
  ◦ Statically accessing the value of a nested map by key using the . operator
  ◦ Dynamically accessing the value of a map by key using the [\ operator and a parameter]

• List operators
  ◦ Concatenating two lists using +
  ◦ Using IN to check if a number is in a list
  ◦ Using IN for more complex list membership operations
  ◦ Accessing elements in a list using the [\ operator]
  ◦ Dynamically accessing an element in a list using the [\ operator and a parameter]
  ◦ Using IN with [\ on a nested list]

### 2.7.1. Operators at a glance

<table>
<thead>
<tr>
<th>Aggregation operators</th>
<th>DISTINCT</th>
</tr>
</thead>
<tbody>
<tr>
<td>Property operators</td>
<td>. for static property access, [] for dynamic property access, = for replacing all properties, += for mutating specific properties</td>
</tr>
<tr>
<td>Mathematical operators</td>
<td>+, -, *, /, %, ^</td>
</tr>
<tr>
<td>Comparison operators</td>
<td>=, &lt;&gt;, &lt;, &gt;, &lt;=, &gt;=, IS NULL, IS NOT NULL</td>
</tr>
<tr>
<td>String-specific comparison operators</td>
<td>STARTS WITH, ENDS WITH, CONTAINS, =~ for regex matching</td>
</tr>
<tr>
<td>Boolean operators</td>
<td>AND, OR, XOR, NOT</td>
</tr>
<tr>
<td>String operators</td>
<td>+ for concatenation</td>
</tr>
<tr>
<td>Temporal operators</td>
<td>+ and - for operations between durations and temporal instants/durations, * and / for operations between durations and numbers</td>
</tr>
<tr>
<td>Map operators</td>
<td>. for static value access by key, [] for dynamic value access by key</td>
</tr>
<tr>
<td>List operators</td>
<td>+ for concatenation, IN to check existence of an element in a list, [] for accessing element(s) dynamically</td>
</tr>
</tbody>
</table>
2.7.2. Aggregation operators

The aggregation operators comprise:

- remove duplicates values: **DISTINCT**

Using the **DISTINCT** operator

Retrieve the unique eye colors from **Person** nodes.

Query

```cypher
CREATE (a:Person {name: 'Anne', eyeColor: 'blue'}),
(b:Person {name: 'Bill', eyeColor: 'brown'}),
(c:Person {name: 'Carol', eyeColor: 'blue'})
WITH [a, b, c] AS ps
UNWIND ps AS p
RETURN DISTINCT p.eyeColor
```

Even though both 'Anne' and 'Carol' have blue eyes, 'blue' is only returned once.

Table 6. Result

<table>
<thead>
<tr>
<th>p.eyeColor</th>
<th>eyeColor</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>&quot;blue&quot;</td>
</tr>
<tr>
<td>&quot;brown&quot;</td>
<td></td>
</tr>
</tbody>
</table>

| Rows: 2     |
| Nodes created: 3 |
| Properties set: 6 |
| Labels added: 3 |

**DISTINCT** is commonly used in conjunction with **aggregating functions**.

2.7.3. Property operators

The property operators pertain to a node or a relationship, and comprise:

- statically access the property of a node or relationship using the dot operator: .
- dynamically access the property of a node or relationship using the subscript operator: []
- property replacement = for replacing all properties of a node or relationship
- property mutation operator += for setting specific properties of a node or relationship

Statically accessing a property of a node or relationship using the . operator
Query

```cypher
CREATE
  (a:Person {name: 'Jane', livesIn: 'London'}),
  (b:Person {name: 'Tom', livesIn: 'Copenhagen'})
WITH a, b
MATCH (p:Person)
RETURN p.name
```

Table 7. Result

<table>
<thead>
<tr>
<th>p.name</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;Jane&quot;</td>
</tr>
<tr>
<td>&quot;Tom&quot;</td>
</tr>
</tbody>
</table>

Rows: 2
Nodes created: 2
Properties set: 4
Labels added: 2

Filtering on a dynamically-computed property key using the `[]` operator

Query

```cypher
CREATE
  (a:Restaurant {name: 'Hungry Jo', rating_hygiene: 10, rating_food: 7}),
  (b:Restaurant {name: 'Buttercup Tea Rooms', rating_hygiene: 5, rating_food: 6}),
  (c1:Category {name: 'hygiene'}),
  (c2:Category {name: 'food'})
WITH a, b, c1, c2
MATCH (restaurant:Restaurant), (category:Category)
WHERE restaurant["rating_" + category.name] > 6
RETURN DISTINCT restaurant.name
```

Table 8. Result

<table>
<thead>
<tr>
<th>restaurant.name</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;Hungry Jo&quot;</td>
</tr>
</tbody>
</table>

Rows: 1
Nodes created: 4
Properties set: 8
Labels added: 4

See Basic usage for more details on dynamic property access.

The behavior of the `[]` operator with respect to null is detailed here.

Replacing all properties of a node or relationship using the `=` operator

Query

```cypher
CREATE (a:Person {name: 'Jane', age: 20})
WITH a
MATCH (p:Person {name: 'Jane'})
SET p = {name: 'Ellen', livesIn: 'London'}
RETURN p.name, p.age, p.livesIn
```
All the existing properties on the node are replaced by those provided in the map; i.e. the name property is updated from Jane to Ellen, the age property is deleted, and the livesIn property is added.

**Table 9. Result**

<table>
<thead>
<tr>
<th>p.name</th>
<th>p.age</th>
<th>p.livesIn</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;Ellen&quot;</td>
<td>&lt;null&gt;</td>
<td>&quot;London&quot;</td>
</tr>
</tbody>
</table>

Rows: 1  
Nodes created: 1  
Properties set: 5  
Labels added: 1

See [Replace all properties using a map and =](#) for more details on using the property replacement operator `=.`

**Mutating specific properties of a node or relationship using the += operator**

**Query**

```sql
CREATE (a:Person {name: 'Jane', age: 20})
WITH a
MATCH (p:Person {name: 'Jane'})
SET p += {name: 'Ellen', livesIn: 'London'}
RETURN p.name, p.age, p.livesIn
```

The properties on the node are updated as follows by those provided in the map: the name property is updated from Jane to Ellen, the age property is left untouched, and the livesIn property is added.

**Table 10. Result**

<table>
<thead>
<tr>
<th>p.name</th>
<th>p.age</th>
<th>p.livesIn</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;Ellen&quot;</td>
<td>20</td>
<td>&quot;London&quot;</td>
</tr>
</tbody>
</table>

Rows: 1  
Nodes created: 1  
Properties set: 4  
Labels added: 1

See [Mutate specific properties using a map and +=](#) for more details on using the property mutation operator `+=`.

### 2.7.4. Mathematical operators

The mathematical operators comprise:

- addition: +
- subtraction or unary minus: -
- multiplication: *
- division: /
- modulo division: %
• exponentiation: ^

Using the exponentiation operator ^

Query

\[
\text{WITH 2 AS number, 3 AS exponent}
\text{RETURN number ^ exponent AS result}
\]

Table 11. Result

<table>
<thead>
<tr>
<th>result</th>
</tr>
</thead>
<tbody>
<tr>
<td>8.0</td>
</tr>
</tbody>
</table>

Rows: 1

Using the unary minus operator -

Query

\[
\text{WITH -3 AS a, 4 AS b}
\text{RETURN b - a AS result}
\]

Table 12. Result

<table>
<thead>
<tr>
<th>result</th>
</tr>
</thead>
<tbody>
<tr>
<td>7</td>
</tr>
</tbody>
</table>

Rows: 1

2.7.5. Comparison operators

The comparison operators comprise:

- equality: =
- inequality: <>
- less than: <
- greater than: >
- less than or equal to: =<
- greater than or equal to: =>
- IS NULL
- IS NOT NULL

String-specific comparison operators comprise:

- STARTS WITH: perform case-sensitive prefix searching on strings
- ENDS WITH: perform case-sensitive suffix searching on strings
• **CONTAINS**: perform case-sensitive inclusion searching in strings

• `=~`: matching a regular expression

### Comparing two numbers

**Query**

```cypher
WITH 4 AS one, 3 AS two
RETURN one > two AS result
```

<table>
<thead>
<tr>
<th>Table 13. Result</th>
</tr>
</thead>
<tbody>
<tr>
<td>result</td>
</tr>
<tr>
<td>Rows: 1</td>
</tr>
</tbody>
</table>

See [Equality and comparison of values](#) for more details on the behavior of comparison operators, and [Using ranges](#) for more examples showing how these may be used.

### Using **STARTS WITH** to filter names

**Query**

```cypher
WITH ['John', 'Mark', 'Jonathan', 'Bill'] AS somenames
UNWIND somenames AS names
WITH names AS candidate
WHERE candidate STARTS WITH 'Jo'
RETURN candidate
```

<table>
<thead>
<tr>
<th>Table 14. Result</th>
</tr>
</thead>
<tbody>
<tr>
<td>candidate</td>
</tr>
<tr>
<td>&quot;Jonathan&quot;</td>
</tr>
<tr>
<td>Rows: 2</td>
</tr>
</tbody>
</table>

String matching contains more information regarding the string-specific comparison operators as well as additional examples illustrating the usage thereof.

### Equality and comparison of values

**Equality**

Cypher supports comparing values (see [Values and types](#)) by equality using the `=` and `<>` operators.

Values of the same type are only equal if they are the same identical value (e.g. `3 = 3` and "x" <> "xy").

Maps are only equal if they map exactly the same keys to equal values and lists are only equal if they contain the same sequence of equal values (e.g. `[3, 4] = [1+2, 8/2]`).
Values of different types are considered as equal according to the following rules:

- Paths are treated as lists of alternating nodes and relationships and are equal to all lists that contain that very same sequence of nodes and relationships.

- Testing any value against null with both the = and the <> operators always is null. This includes null = null and null <> null. The only way to reliably test if a value \(v\) is null is by using the special \(v\) IS NULL, or \(v\) IS NOT NULL equality operators.

All other combinations of types of values cannot be compared with each other. Especially, nodes, relationships, and literal maps are incomparable with each other.

It is an error to compare values that cannot be compared.

### Ordering and comparison of values

The comparison operators <=, < (for ascending) and >=, > (for descending) are used to compare values for ordering. The following points give some details on how the comparison is performed.

- Numerical values are compared for ordering using numerical order (e.g. 3 < 4 is true).

- The special value `java.lang.Double.NaN` is regarded as being larger than all other numbers.

- String values are compared for ordering using lexicographic order (e.g. "x" < "xy").

- Boolean values are compared for ordering such that false < true.

- **Comparison of spatial values:**
  - Point values can only be compared within the same Coordinate Reference System (CRS) — otherwise, the result will be null.
  - For two points \(a\) and \(b\) within the same CRS, \(a\) is considered to be greater than \(b\) if \(a.x > b.x\) and \(a.y > b.y\) (and \(a.z > b.z\) for 3D points).
  - \(a\) is considered less than \(b\) if \(a.x < b.x\) and \(a.y < b.y\) (and \(a.z < b.z\) for 3D points).
  - If none if the above is true, the points are considered incomparable and any comparison operator between them will return null.

- **Ordering of spatial values:**
  - ORDER BY requires all values to be orderable.
  - Points are ordered after arrays and before temporal types.
  - Points of different CRS are ordered by the CRS code (the value of SRID field). For the currently supported set of Coordinate Reference Systems this means the order: 4326, 4979, 7302, 9157
  - Points of the same CRS are ordered by each coordinate value in turn, \(x\) first, then \(y\) and finally \(z\).
  - Note that this order is different to the order returned by the spatial index, which will be the order of the space filling curve.

- **Comparison of temporal values:**
  - Temporal instant values are comparable within the same type. An instant is considered less than another instant if it occurs before that instant in time, and it is considered greater than if it occurs after.
° Instant values that occur at the same point in time — but that have a different time zone — are not considered equal, and must therefore be ordered in some predictable way. Cypher prescribes that, after the primary order of point in time, instant values be ordered by effective time zone offset, from west (negative offset from UTC) to east (positive offset from UTC). This has the effect that times that represent the same point in time will be ordered with the time with the earliest local time first. If two instant values represent the same point in time, and have the same time zone offset, but a different named time zone (this is possible for DateTime only, since Time only has an offset), these values are not considered equal, and ordered by the time zone identifier, alphabetically, as its third ordering component. If the type, point in time, offset, and time zone name are all equal, then the values are equal, and any difference in order is impossible to observe.

° Duration values cannot be compared, since the length of a day, month or year is not known without knowing which day, month or year it is. Since Duration values are not comparable, the result of applying a comparison operator between two Duration values is null.

• Ordering of temporal values:
  ° ORDER BY requires all values to be orderable.
  ° Temporal instances are ordered after spatial instances and before strings.
  ° Comparable values should be ordered in the same order as implied by their comparison order.
  ° Temporal instant values are first ordered by type, and then by comparison order within the type.
  ° Since no complete comparison order can be defined for Duration values, we define an order for ORDER BY specifically for Duration:
    ▪ Duration values are ordered by normalising all components as if all years were 365.2425 days long (PT8765H49M12S), all months were 30.436875 (1/12 year) days long (PT730H29M06S), and all days were 24 hours long [1]:

• Comparing for ordering when one argument is null (e.g. null < 3 is null).

• Ordering of values with different types:
  ° The ordering is, in ascending order, defined according to the following list:
    ▪ Map
    ▪ Node
    ▪ Relationship
    ▪ List
    ▪ Path
    ▪ DateTime
    ▪ LocalDateTime
    ▪ Date
    ▪ Time
    ▪ LocalTime
    ▪ Duration
    ▪ String
- **Boolean**
- **Number**
  - The value `null` is considered larger than any value.

- **Ordering** of composite type values:
  - For the composite types (e.g. maps and lists), elements of the containers are compared pairwise for ordering and thus determine the ordering of two container types. For example, `[1, 'foo', 3]` is ordered before `[1, 2, 'bar']` since `'foo'` is ordered before `2`.

### Chaining comparison operations

Comparisons can be chained arbitrarily, e.g., `x < y <= z` is equivalent to `x < y AND y <= z`.

Formally, if `a`, `b`, `c`, ..., `y`, `z` are expressions and `op1`, `op2`, ..., `opN` are comparison operators, then `a op1 b op2 c ... y opN z` is equivalent to `a op1 b and b op2 c and ... y opN z`.

Note that `a op1 b op2 c` does not imply any kind of comparison between `a` and `c`, so that, e.g., `x < y > z` is perfectly legal (although perhaps not elegant).

The example:

```
MATCH (n) WHERE 21 < n.age <= 30 RETURN n
```

is equivalent to

```
MATCH (n) WHERE 21 < n.age AND n.age <= 30 RETURN n
```

Thus, it matches all nodes where the age is between 21 and 30.

This syntax extends to all equality `=` and inequality `<>` comparisons, as well as to chains longer than three.

- **Chains of `=` and `<>` are treated in a special way in Cypher.**
  - This means that `1=1=true` is equivalent to `1=1 AND 1=true` and not to `(1=1)=true` or `1=(1=true)`.

For example:

```
a < b = c <= d <> e
```

Is equivalent to:

```
a < b AND b = c AND c <= d AND d <> e
```

[1] The 365.2425 days per year comes from the frequency of leap years. A leap year occurs on a year with an ordinal number divisible by 4, that is not divisible by 100, unless it is divisible by 400. This means that over 400 years there are ```((365 * 4 + 1) * 25 - 1) * 4 + 1 = 146097``` days, which means an average of 365.2425 days per year.
Chapter 3. Using a regular expression with =~ to filter words

Query

WITH ['mouse', 'chair', 'door', 'house'] AS wordlist
UNWIND wordlist AS word
WITH word
WHERE word =~ '.*ous.*'
RETURN word

Table 15. Result

<table>
<thead>
<tr>
<th>word</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;mouse&quot;</td>
</tr>
<tr>
<td>&quot;house&quot;</td>
</tr>
</tbody>
</table>

Rows: 2

Further information and examples regarding the use of regular expressions in filtering can be found in Regular expressions.
Chapter 4. Boolean operators

The boolean operators — also known as logical operators — comprise:

- conjunction: AND
- disjunction: OR,
- exclusive disjunction: XOR
- negation: NOT

Here is the truth table for AND, OR, XOR and NOT.

<table>
<thead>
<tr>
<th>a</th>
<th>b</th>
<th>a AND b</th>
<th>a OR b</th>
<th>a XOR b</th>
<th>NOT a</th>
</tr>
</thead>
<tbody>
<tr>
<td>false</td>
<td>false</td>
<td>false</td>
<td>false</td>
<td>false</td>
<td>true</td>
</tr>
<tr>
<td>false</td>
<td>null</td>
<td>false</td>
<td>null</td>
<td>null</td>
<td>true</td>
</tr>
<tr>
<td>false</td>
<td>true</td>
<td>false</td>
<td>true</td>
<td>true</td>
<td>true</td>
</tr>
<tr>
<td>true</td>
<td>false</td>
<td>false</td>
<td>true</td>
<td>true</td>
<td>false</td>
</tr>
<tr>
<td>true</td>
<td>true</td>
<td>true</td>
<td>true</td>
<td>false</td>
<td>false</td>
</tr>
<tr>
<td>null</td>
<td>false</td>
<td>false</td>
<td>null</td>
<td>null</td>
<td>null</td>
</tr>
<tr>
<td>null</td>
<td>null</td>
<td>null</td>
<td>null</td>
<td>null</td>
<td>null</td>
</tr>
<tr>
<td>null</td>
<td>true</td>
<td>null</td>
<td>true</td>
<td>null</td>
<td>null</td>
</tr>
</tbody>
</table>

4.1. Using boolean operators to filter numbers

Query

```sql
WITH [2, 4, 7, 9, 12] AS numberlist
UNWIND numberlist AS number
WITH number
WHERE number = 4 OR (number > 6 AND number < 10)
RETURN number
```

Table 16. Result

<table>
<thead>
<tr>
<th>number</th>
</tr>
</thead>
<tbody>
<tr>
<td>4</td>
</tr>
<tr>
<td>7</td>
</tr>
<tr>
<td>9</td>
</tr>
</tbody>
</table>

Rows: 3
Chapter 5. String operators

The string operators comprise:

- concatenating strings: +

5.1. Concatenating two strings with +

Query

```
RETURN 'neo' + '4j' AS result
```

Table 17. Result

<table>
<thead>
<tr>
<th>result</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;neo4j&quot;</td>
</tr>
</tbody>
</table>

Rows: 1
Chapter 6. Temporal operators

Temporal operators comprise:

- adding a Duration to either a temporal instant or another Duration: +
- subtracting a Duration from either a temporal instant or another Duration: -
- multiplying a Duration with a number: *
- dividing a Duration by a number: /

The following table shows — for each combination of operation and operand type — the type of the value returned from the application of each temporal operator:

<table>
<thead>
<tr>
<th>Operator</th>
<th>Left-hand operand</th>
<th>Right-hand operand</th>
<th>Type of result</th>
</tr>
</thead>
<tbody>
<tr>
<td>+</td>
<td>Temporal instant</td>
<td>Duration</td>
<td>The type of the temporal instant</td>
</tr>
<tr>
<td>+</td>
<td>Duration</td>
<td>Temporal instant</td>
<td>The type of the temporal instant</td>
</tr>
<tr>
<td>-</td>
<td>Temporal instant</td>
<td>Duration</td>
<td>The type of the temporal instant</td>
</tr>
<tr>
<td>-</td>
<td>Duration</td>
<td>Duration</td>
<td>Duration</td>
</tr>
<tr>
<td>*</td>
<td>Duration</td>
<td>Number</td>
<td>Duration</td>
</tr>
<tr>
<td>*</td>
<td>Number</td>
<td>Duration</td>
<td>Duration</td>
</tr>
<tr>
<td>/</td>
<td>Duration</td>
<td>Number</td>
<td>Duration</td>
</tr>
</tbody>
</table>

6.1. Adding and subtracting a Duration to or from a temporal instant

Query

WITH
  localdatetime({year: 1984, month: 10, day: 11, hour: 12, minute: 31, second: 14}) AS aDateTime,
  duration({years: 12, nanoseconds: 2}) AS aDuration
RETURN aDateTime + aDuration, aDateTime - aDuration

Table 18. Result

<table>
<thead>
<tr>
<th>aDateTime + aDuration</th>
<th>aDateTime - aDuration</th>
</tr>
</thead>
</table>

Components of a Duration that do not apply to the temporal instant are ignored. For example, when adding a Duration to a Date, the hours, minutes, seconds and nanoseconds of the Duration are ignored.
(Time behaves in an analogous manner):

Query

WITH
date((year:1984, month:10, day:11)) AS aDate,
duration((years:12, nanoseconds:2)) AS aDuration
RETURN aDate + aDuration, aDate - aDuration

Table 19. Result

<table>
<thead>
<tr>
<th>aDate + aDuration</th>
<th>aDate - aDuration</th>
</tr>
</thead>
<tbody>
<tr>
<td>1996-10-11</td>
<td>1972-10-11</td>
</tr>
</tbody>
</table>

Rows: 1

Adding two durations to a temporal instant is not an associative operation. This is because non-existing dates are truncated to the nearest existing date:

Query

RETURN
(date("2011-01-31") + duration("P1M")) + duration("P12M") AS date1,
date("2011-01-31") + (duration("P1M") + duration("P12M")) AS date2

Table 20. Result

<table>
<thead>
<tr>
<th>date1</th>
<th>date2</th>
</tr>
</thead>
<tbody>
<tr>
<td>2012-02-28</td>
<td>2012-02-29</td>
</tr>
</tbody>
</table>

Rows: 1

6.2. Adding and subtracting a Duration to or from another Duration

Query

WITH
duration((years:12, months:5, days:14, hours:16, minutes:12, seconds:70, nanoseconds:1)) as duration1,
duration((months:1, days:-14, hours:16, minutes:-12, seconds:70)) AS duration2
RETURN duration1, duration2, duration1 + duration2, duration1 - duration2

Table 21. Result

<table>
<thead>
<tr>
<th>duration1</th>
<th>duration2</th>
<th>duration1 + duration2</th>
<th>duration1 - duration2</th>
</tr>
</thead>
<tbody>
<tr>
<td>P12YM14DT16H13M10.000000000S</td>
<td>P1M-14DT15H49M10S</td>
<td>P12YM14DT16H13M10.000000001S</td>
<td>P12YM14DT15H49M10S</td>
</tr>
</tbody>
</table>

Rows: 1
6.3. Multiplying and dividing a Duration with or by a number

These operations are interpreted simply as component-wise operations with overflow to smaller units based on an average length of units in the case of division (and multiplication with fractions).

Query

```
WITH duration({
    days: 14,
    minutes: 12,
    seconds: 70,
    nanoseconds: 1
}) AS aDuration
RETURN aDuration, aDuration * 2, aDuration / 3
```

Table 22. Result

<table>
<thead>
<tr>
<th>aDuration</th>
<th>aDuration * 2</th>
<th>aDuration / 3</th>
</tr>
</thead>
<tbody>
<tr>
<td>P14DT13M10.0000000S</td>
<td>P28DT26M20.0000000S</td>
<td>P4DT16H4M23.3333333S</td>
</tr>
</tbody>
</table>

Rows: 1
Chapter 7. Map operators

The map operators comprise:

- statically access the value of a map by key using the dot operator: .
- dynamically access the value of a map by key using the subscript operator: []

The behavior of the [] operator with respect to null is detailed in The [] operator and null.

7.1. Statically accessing the value of a nested map by key using the . operator

Query

```sql
WITH { person: { name: 'Anne', age: 25 } } AS p
RETURN p.person.name
```

Table 23. Result

<table>
<thead>
<tr>
<th>p.person.name</th>
<th>&quot;Anne&quot;</th>
</tr>
</thead>
<tbody>
<tr>
<td>Rows: 1</td>
<td></td>
</tr>
</tbody>
</table>

7.2. Dynamically accessing the value of a map by key using the [] operator and a parameter

A parameter may be used to specify the key of the value to access:

Parameters

```json
{
  "myKey": "name"
}
```

Query

```sql
WITH { name: 'Anne', age: 25 } AS a
RETURN a["myKey"] AS result
```

Table 24. Result

<table>
<thead>
<tr>
<th>result</th>
<th>&quot;Anne&quot;</th>
</tr>
</thead>
<tbody>
<tr>
<td>Rows: 1</td>
<td></td>
</tr>
</tbody>
</table>

More details on maps can be found in Maps.
Chapter 8. List operators

The list operators comprise:

- concatenating lists \( l_1 \) and \( l_2 \): \( l_1[1] + l_2[1] \)
- checking if an element \( e \) exists in a list \( l_1 \): \( e \ \text{IN} \ l_1 \)
- dynamically accessing an element(s) in a list using the subscript operator: \( [] \)

The behavior of the \( \text{IN} \) and \( [] \) operators with respect to \( \text{null} \) is detailed here.

8.1. Concatenating two lists using +

Query

```plaintext
RETURN [1,2,3,4,5] + [6,7] AS myList
```

Table 25. Result

<table>
<thead>
<tr>
<th>myList</th>
</tr>
</thead>
<tbody>
<tr>
<td>[1,2,3,4,5,6,7]</td>
</tr>
<tr>
<td>Rows: 1</td>
</tr>
</tbody>
</table>

8.2. Using \( \text{IN} \) to check if a number is in a list

Query

```plaintext
WITH [2,3,4,5] AS numberlist
UNWIND numberlist AS number
WITH number
WHERE number \( \text{IN} \) [2,3,8]
RETURN number
```

Table 26. Result

<table>
<thead>
<tr>
<th>number</th>
</tr>
</thead>
<tbody>
<tr>
<td>2</td>
</tr>
<tr>
<td>3</td>
</tr>
<tr>
<td>Rows: 2</td>
</tr>
</tbody>
</table>

8.3. Using \( \text{IN} \) for more complex list membership operations

The general rule is that the \( \text{IN} \) operator will evaluate to \( \text{true} \) if the list given as the right-hand operand contains an element which has the same type and contents (or value) as the left-hand operand. Lists are only comparable to other lists, and elements of a list \( \text{innerList} \) are compared pairwise in ascending order from the first element in \( \text{innerList} \) to the last element in \( \text{innerList} \).
The following query checks whether or not the list $[2, 1]$ is an element of the list $[1, [2, 1], 3]$:

```
RETURN [2, 1] IN [1, [2, 1], 3] AS inList
```

The query evaluates to `true` as the right-hand list contains, as an element, the list $[1, 2]$ which is of the same type (a list) and contains the same contents (the numbers $2$ and $1$ in the given order) as the left-hand operand. If the left-hand operator had been $[1, 2]$ instead of $[2, 1]$, the query would have returned `false`.

**Table 27. Result**

<table>
<thead>
<tr>
<th>inList</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>true</td>
<td></td>
</tr>
</tbody>
</table>

Rows: 1

At first glance, the contents of the left-hand operand and the right-hand operand appear to be the same in the following query:

```
RETURN [1, 2] IN [1, 2] AS inList
```

However, `IN` evaluates to `false` as the right-hand operand does not contain an element that is of the same type — i.e. a list — as the left-hand operand.

**Table 28. Result**

<table>
<thead>
<tr>
<th>inList</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>false</td>
<td></td>
</tr>
</tbody>
</table>

Rows: 1

The following query can be used to ascertain whether or not a list — obtained from, say, the `labels()` function — contains at least one element that is also present in another list:

```
MATCH (n)
WHERE size(labels(n)) > 0
RETURN count(n)
```

As long as `labels(n)` returns either `Person` or `Employee` (or both), the query will return a value greater than zero.

### 8.4. Accessing elements in a list using the `[]` operator

```
WITH ['Anne', 'John', 'Bill', 'Diane', 'Eve'] AS names
RETURN names[1..3] AS result
```
The square brackets will extract the elements from the start index 1, and up to (but excluding) the end
index 3.
Table 29. Result
result
["John","Bill"]
Rows: 1

8.5. Dynamically accessing an element in a list using the []
operator and a parameter
A parameter may be used to specify the index of the element to access:
Parameters
{
"myIndex" : 1
}

Query
WITH ['Anne', 'John', 'Bill', 'Diane', 'Eve'] AS names
RETURN names[$myIndex] AS result

Table 30. Result
result
"John"
Rows: 1

8.6. Using IN with [] on a nested list
IN can be used in conjunction with [] to test whether an element exists in a nested list:
Parameters
{
}

"myIndex" : 1

Query
WITH [[1, 2, 3]] AS l
RETURN 3 IN l[0] AS result

Table 31. Result
result
true

51


More details on lists can be found in Lists in general.

8.7. Comments

This section describes how to use comments in Cypher.

A comment begins with double slash (//) and continues to the end of the line. Comments do not execute, they are for humans to read.

Examples:

```
MATCH (n) RETURN n //This is an end of line comment
```

```
MATCH (n)
//This is a whole line comment
RETURN n
```

```
MATCH (n) WHERE n.property = '//This is NOT a comment' RETURN n
```

8.8. Patterns

This section contains an overview of data patterns in Cypher.

- Introduction
- Patterns for nodes
- Patterns for related nodes
- Patterns for labels
- Specifying properties
- Patterns for relationships
- Variable-length pattern matching
- Assigning to path variables

8.8.1. Introduction

Patterns and pattern-matching are at the very heart of Cypher, so being effective with Cypher requires a good understanding of patterns.

Using patterns, you describe the shape of the data you are looking for. For example, in the MATCH clause you describe the shape with a pattern, and Cypher will figure out how to get that data for you.
The pattern describes the data using a form that is very similar to how one typically draws the shape of property graph data on a whiteboard: usually as circles (representing nodes) and arrows between them to represent relationships.

Patterns appear in multiple places in Cypher: in MATCH, CREATE and MERGE clauses, and in pattern expressions. Each of these is described in more detail in:

- MATCH
- OPTIONAL MATCH
- CREATE
- MERGE
- Using path patterns in WHERE

8.8.2. Patterns for nodes

The very simplest 'shape' that can be described in a pattern is a node. A node is described using a pair of parentheses, and is typically given a name. For example:

```
(a)
```

This simple pattern describes a single node, and names that node using the variable \(a\).

8.8.3. Patterns for related nodes

A more powerful construct is a pattern that describes multiple nodes and relationships between them. Cypher patterns describe relationships by employing an arrow between two nodes. For example:

```
(a)-->(b)
```

This pattern describes a very simple data shape: two nodes, and a single relationship from one to the other. In this example, the two nodes are both named as \(a\) and \(b\) respectively, and the relationship is 'directed': it goes from \(a\) to \(b\).

This manner of describing nodes and relationships can be extended to cover an arbitrary number of nodes and the relationships between them, for example:

```
(a)-->(b)<--(c)
```

Such a series of connected nodes and relationships is called a "path".

Note that the naming of the nodes in these patterns is only necessary should one need to refer to the same node again, either later in the pattern or elsewhere in the Cypher query. If this is not necessary, then the name may be omitted, as follows:

```
(a)-->(c)
```
8.8.4. Patterns for labels

In addition to simply describing the shape of a node in the pattern, one can also describe attributes. The most simple attribute that can be described in the pattern is a label that the node must have. For example:

(a:User)-->(b)

One can also describe a node that has multiple labels:

(a:User:Admin)-->(b)

8.8.5. Specifying properties

Nodes and relationships are the fundamental structures in a graph. Neo4j uses properties on both of these to allow for far richer models.

Properties can be expressed in patterns using a map-construct: curly brackets surrounding a number of key-expression pairs, separated by commas. E.g. a node with two properties on it would look like:

(a {name: 'Andy', sport: 'Brazilian Ju-Jitsu'})

A relationship with expectations on it is given by:

(a)-[{}]->(b)

When properties appear in patterns, they add an additional constraint to the shape of the data. In the case of a CREATE clause, the properties will be set in the newly-created nodes and relationships. In the case of a MERGE clause, the properties will be used as additional constraints on the shape any existing data must have (the specified properties must exactly match any existing data in the graph). If no matching data is found, then MERGE behaves like CREATE and the properties will be set in the newly created nodes and relationships.

Note that patterns supplied to CREATE may use a single parameter to specify properties, e.g: CREATE (node $paramName). This is not possible with patterns used in other clauses, as Cypher needs to know the property names at the time the query is compiled, so that matching can be done effectively.

8.8.6. Patterns for relationships

The simplest way to describe a relationship is by using the arrow between two nodes, as in the previous examples. Using this technique, you can describe that the relationship should exist and the directionality of it. If you don’t care about the direction of the relationship, the arrow head can be omitted, as exemplified by:

(a)-->(b)

As with nodes, relationships may also be given names. In this case, a pair of square brackets is used to
break up the arrow and the variable is placed between. For example:

```
(a)-[r]->(b)
```

Much like labels on nodes, relationships can have types. To describe a relationship with a specific type, you can specify this as follows:

```
(a)-[r:REL_TYPE]->(b)
```

Unlike labels, relationships can only have one type. But if we’d like to describe some data such that the relationship could have any one of a set of types, then they can all be listed in the pattern, separating them with the pipe symbol `|` like this:

```
(a)-[r:TYPE1|TYPE2]->(b)
```

Note that this form of pattern can only be used to describe existing data (ie. when using a pattern with `MATCH` or as an expression). It will not work with `CREATE` or `MERGE`, since it’s not possible to create a relationship with multiple types.

As with nodes, the name of the relationship can always be omitted, as exemplified by:

```
(a)-[:REL_TYPE]->(b)
```

8.8.7. Variable-length pattern matching

Variable length pattern matching in versions 2.1.x and earlier does not enforce relationship uniqueness for patterns described within a single `MATCH` clause. This means that a query such as the following: `MATCH (a)-[r]->(b), p = (a)-[r]->(c) RETURN *`, `relationships(p) AS rs` may include `r` as part of the `rs` set. This behavior has changed in versions 2.2.0 and later, in such a way that `r` will be excluded from the result set, as this better adheres to the rules of relationship uniqueness as documented here Cypher path matching. If you have a query pattern that needs to retrace relationships rather than ignoring them as the relationship uniqueness rules normally dictate, you can accomplish this using multiple match clauses, as follows: `MATCH (a)-[r]->(b) MATCH p = (a)-[r]->(c) RETURN *`, `relationships(p)`. This will work in all versions of Neo4j that support the `MATCH` clause, namely 2.0.0 and later.

Rather than describing a long path using a sequence of many node and relationship descriptions in a pattern, many relationships (and the intermediate nodes) can be described by specifying a length in the relationship description of a pattern. For example:

```
(a)-[*2]->(b)
```

This describes a graph of three nodes and two relationships, all in one path (a path of length 2). This is equivalent to:
A range of lengths can also be specified: such relationship patterns are called 'variable length relationships'. For example:

\[(a)\rightarrow(*)\rightarrow(b)\]

This is a minimum length of 3, and a maximum of 5. It describes a graph of either 4 nodes and 3 relationships, 5 nodes and 4 relationships or 6 nodes and 5 relationships, all connected together in a single path.

Either bound can be omitted. For example, to describe paths of length 3 or more, use:

\[(a)\rightarrow[*3..]*\rightarrow(b)\]

To describe paths of length 5 or less, use:

\[(a)\rightarrow[*..5]*\rightarrow(b)\]

Omitting both bounds is equivalent to specifying a minimum of 1, allowing paths of any positive length to be described:

\[(a)\rightarrow[*]*\rightarrow(b)\]

As a simple example, let's take the graph and query below:

Graph

Query

```
MATCH (me):[KNOWS*1..2]-{(remote_friend)
WHERE me.name = 'Filipa'
RETURN remote_friend.name
```

Table 32. Result

<table>
<thead>
<tr>
<th>remote_friend.name</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;Dilshad&quot;</td>
</tr>
</tbody>
</table>
remote_friend.name

"Anders"

Rows: 2

This query finds data in the graph with a shape that fits the pattern: specifically a node (with the name property 'Filipa') and then the \texttt{KNOWS} related nodes, one or two hops away. This is a typical example of finding first and second degree friends.

Note that variable length relationships cannot be used with \texttt{CREATE} and \texttt{MERGE}.

8.8.8. Assigning to path variables

As described above, a series of connected nodes and relationships is called a "path". Cypher allows paths to be named using an identifier, as exemplified by:

\[
p = (a)-[*3..5]->(b)
\]

You can do this in \texttt{MATCH}, \texttt{CREATE} and \texttt{MERGE}, but not when using patterns as expressions.

8.9. Temporal (Date/Time) values

Cypher has built-in support for handling temporal values, and the underlying database supports storing these temporal values as properties on nodes and relationships.

- Refer to Temporal functions - instant types for information regarding temporal functions allowing for the creation and manipulation of temporal values.
- Refer to Temporal operators for information regarding temporal operators.
- Refer to Ordering and comparison of values for information regarding the comparison and ordering of temporal values.

The following table lists the temporal value types and supported components:

<table>
<thead>
<tr>
<th>Type</th>
<th>Date support</th>
<th>Time support</th>
<th>Time zone support</th>
</tr>
</thead>
<tbody>
<tr>
<td>Date</td>
<td>✓</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Time</td>
<td></td>
<td>✓</td>
<td>✓</td>
</tr>
<tr>
<td>LocalTime</td>
<td></td>
<td>✓</td>
<td>✓</td>
</tr>
<tr>
<td>DateTime</td>
<td>✓</td>
<td>✓</td>
<td>✓</td>
</tr>
<tr>
<td>LocalDateTime</td>
<td>✓</td>
<td>✓</td>
<td></td>
</tr>
<tr>
<td>Duration</td>
<td>-</td>
<td>-</td>
<td>-</td>
</tr>
</tbody>
</table>

\texttt{Date}, \texttt{Time}, \texttt{LocalTime}, \texttt{DateTime} and \texttt{LocalDateTime} are temporal instant types. A temporal instant value expresses a point in time with varying degrees of precision.
By contrast, Duration is not a temporal instant type. A Duration represents a temporal amount, capturing the difference in time between two instants, and can be negative. Duration captures the amount of time between two instants, it does not capture a start time and end time.

8.9.1. Time zones

Time zones are represented either as an offset from UTC, or as a logical identifier of a named time zone (these are based on the IANA time zone database). In either case the time is stored as UTC internally, and the time zone offset is only applied when the time is presented. This means that temporal instants can be ordered without taking time zone into account. If, however, two times are identical in UTC, then they are ordered by timezone.

When creating a time using a named time zone, the offset from UTC is computed from the rules in the time zone database to create a time instant in UTC, and to ensure the named time zone is a valid one.

It is possible for time zone rules to change in the IANA time zone database. For example, there could be alterations to the rules for daylight savings time in a certain area. If this occurs after the creation of a temporal instant, the presented time could differ from the originally-entered time, insofar as the local timezone is concerned. However, the absolute time in UTC would remain the same.

There are three ways of specifying a time zone in Cypher:

- Specifying the offset from UTC in hours and minutes (ISO 8601).
- Specifying a named time zone.
- Specifying both the offset and the time zone name (with the requirement that these match).

The named time zone form uses the rules of the IANA time zone database to manage daylight savings time (DST).

The default time zone of the database can be configured using the configuration option db.temporal.timezone. This configuration option influences the creation of temporal types for the following functions:

- Getting the current date and time without specifying a time zone.
- Creating a temporal type from its components without specifying a time zone.
- Creating a temporal type by parsing a string without specifying a time zone.
- Creating a temporal type by combining or selecting values that do not have a time zone component, and without specifying a time zone.
- Truncating a temporal value that does not have a time zone component, and without specifying a time zone.

8.9.2. Temporal instants

Specifying temporal instants

A temporal instant consists of three parts; the date, the time, and the timezone. These parts can be
combined to produce the various temporal value types. The character T is a literal character.

<table>
<thead>
<tr>
<th>Temporal instant type</th>
<th>Composition of parts</th>
</tr>
</thead>
<tbody>
<tr>
<td>Date</td>
<td>&lt;date&gt;</td>
</tr>
<tr>
<td>Time</td>
<td>&lt;time&gt;&lt;timezone&gt; or T&lt;time&gt;&lt;timezone&gt;</td>
</tr>
<tr>
<td>LocalTime</td>
<td>&lt;time&gt; or T&lt;time&gt;</td>
</tr>
<tr>
<td>DateTime*</td>
<td>&lt;date&gt;T&lt;time&gt;&lt;timezone&gt;</td>
</tr>
<tr>
<td>LocalDateTime*</td>
<td>&lt;date&gt;T&lt;time&gt;</td>
</tr>
</tbody>
</table>

*When date and time are combined, date must be complete; i.e. fully identify a particular day.

### Specifying dates

<table>
<thead>
<tr>
<th>Component</th>
<th>Format</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Year</td>
<td>YYYY</td>
<td>Specified with at least four digits (special rules apply in certain cases).</td>
</tr>
<tr>
<td>Month</td>
<td>MM</td>
<td>Specified with a double digit number from 01 to 12.</td>
</tr>
<tr>
<td>Week</td>
<td>WW</td>
<td>Always prefixed with W and specified with a double digit number from 01 to 53.</td>
</tr>
<tr>
<td>Quarter</td>
<td>q</td>
<td>Always prefixed with Q and specified with a single digit number from 1 to 4.</td>
</tr>
<tr>
<td>Day of the month</td>
<td>DD</td>
<td>Specified with a double digit number from 01 to 31.</td>
</tr>
<tr>
<td>Day of the week</td>
<td>D</td>
<td>Specified with a single digit number from 1 to 7.</td>
</tr>
<tr>
<td>Day of the quarter</td>
<td>DD</td>
<td>Specified with a double digit number from 01 to 92.</td>
</tr>
<tr>
<td>Ordinal day of the year</td>
<td>DDD</td>
<td>Specified with a triple digit number from 001 to 366.</td>
</tr>
</tbody>
</table>

If the year is before 0000 or after 9999, the following additional rules apply:

- Minus sign, - must prefix any year before 0000, (e.g. -3000-01-01).
- Plus sign, + must prefix any year after 9999, (e.g. +11000-01-01).
- The year must be separated with - from the next component:
  - if the next component is month, (e.g. +11000-01).
  - if the next component is day of the year, (e.g. +11000-123).

If the year component is prefixed with either - or +, and is separated from the next component, Year is allowed to contain up to nine digits. Thus, the allowed range of years is between -999,999,999 and
+999,999,999. For all other cases, i.e. the year is between 0000 and 9999 (inclusive), Year must have exactly four digits (the year component is interpreted as a year of the Common Era (CE)).

The following formats are supported for specifying dates:

<table>
<thead>
<tr>
<th>Format</th>
<th>Description</th>
<th>Example</th>
<th>Interpretation of example</th>
</tr>
</thead>
<tbody>
<tr>
<td>YYYY-MM-DD</td>
<td>Calendar date: Year-Month-Day</td>
<td>2015-07-21</td>
<td>2015-07-21</td>
</tr>
<tr>
<td>YYYYMMDD</td>
<td>Calendar date: Year-Month-Day</td>
<td>20150721</td>
<td>2015-07-21</td>
</tr>
<tr>
<td>YYYY-MM</td>
<td>Calendar date: Year-Month</td>
<td>2015-07</td>
<td>2015-07-01</td>
</tr>
<tr>
<td>YYYYMM</td>
<td>Calendar date: Year-Month</td>
<td>201507</td>
<td>2015-07-01</td>
</tr>
<tr>
<td>YYYY-Www-D</td>
<td>Week date: Year-Week-Day</td>
<td>2015-W30-2</td>
<td>2015-07-21</td>
</tr>
<tr>
<td>YYYYWwwD</td>
<td>Week date: Year-Week-Date</td>
<td>2015W302</td>
<td>2015-07-21</td>
</tr>
<tr>
<td>YYYY-Www</td>
<td>Week date: Year-Week</td>
<td>2015-W30</td>
<td>2015-07-20</td>
</tr>
<tr>
<td>YYYYWww</td>
<td>Week date: Year-Week</td>
<td>2015W30</td>
<td>2015-07-20</td>
</tr>
<tr>
<td>YYYY-Qq-DD</td>
<td>Quarter date: Year-Quarter-Day</td>
<td>2015-Q2-60</td>
<td>2015-05-30</td>
</tr>
<tr>
<td>YYYYQqDD</td>
<td>Quarter date: Year-Quarter-Day</td>
<td>2015Q260</td>
<td>2015-05-30</td>
</tr>
<tr>
<td>YYYY-Qq</td>
<td>Quarter date: Year-Quarter</td>
<td>2015-Q2</td>
<td>2015-04-01</td>
</tr>
<tr>
<td>YYYYQq</td>
<td>Quarter date: Year-Quarter</td>
<td>2015Q2</td>
<td>2015-04-01</td>
</tr>
<tr>
<td>YYYY-DDD</td>
<td>Ordinal date: Year-Day</td>
<td>2015-202</td>
<td>2015-07-21</td>
</tr>
<tr>
<td>YYYYDDDD</td>
<td>Ordinal date: Year-Day</td>
<td>2015202</td>
<td>2015-07-21</td>
</tr>
<tr>
<td>YYYY</td>
<td>Year</td>
<td>2015</td>
<td>2015-01-01</td>
</tr>
</tbody>
</table>

The least significant components can be omitted. Cypher will assume omitted components to have their lowest possible value. For example, 2013-06 will be interpreted as being the same date as 2013-06-01.

Specifying times

<table>
<thead>
<tr>
<th>Component</th>
<th>Format</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Hour</td>
<td>HH</td>
<td>Specified with a double digit number from 00 to 23.</td>
</tr>
<tr>
<td>Minute</td>
<td>MM</td>
<td>Specified with a double digit number from 00 to 59.</td>
</tr>
<tr>
<td>Second</td>
<td>SS</td>
<td>Specified with a double digit number from 00 to 59.</td>
</tr>
</tbody>
</table>
Cypher does not support leap seconds; UTC-SLS (UTC with Smoothed Leap Seconds) is used to manage the difference in time between UTC and TAI (International Atomic Time).

The following formats are supported for specifying times:

<table>
<thead>
<tr>
<th>Format</th>
<th>Description</th>
<th>Example</th>
<th>Interpretation of example</th>
</tr>
</thead>
<tbody>
<tr>
<td>HHMMSS.sssssss</td>
<td>Hour:Minute:Second.fraction</td>
<td>214032.142</td>
<td>21:40:32.142</td>
</tr>
<tr>
<td>HHMMSS</td>
<td>Hour:Minute:Second</td>
<td>214032</td>
<td>21:40:32.000</td>
</tr>
<tr>
<td>HH:MM</td>
<td>Hour:Minute</td>
<td>21:40</td>
<td>21:40:00.000</td>
</tr>
<tr>
<td>HHMM</td>
<td>Hour:Minute</td>
<td>2140</td>
<td>21:40:00.000</td>
</tr>
<tr>
<td>HH</td>
<td>Hour</td>
<td>21</td>
<td>21:00:00.000</td>
</tr>
</tbody>
</table>

The least significant components can be omitted. For example, a time may be specified with Hour and Minute, leaving out Second and fraction. On the other hand, specifying a time with Hour and Second, while leaving out Minute, is not possible.

Specifying time zones

The time zone is specified in one of the following ways:

- As an offset from UTC.
- Using the Z shorthand for the UTC (±00:00) time zone.

When specifying a time zone as an offset from UTC, the rules below apply:

- The time zone always starts with either a plus (+) or minus (-) sign.
  - Positive offsets, i.e. time zones beginning with +, denote time zones east of UTC.
  - Negative offsets, i.e. time zones beginning with -, denote time zones west of UTC.
- A double-digit hour offset follows the +/- sign.
- An optional double-digit minute offset follows the hour offset, optionally separated by a colon (:).
- The time zone of the International Date Line is denoted either by +12:00 or -12:00, depending on
country.

When creating values of the DateTime temporal instant type, the time zone may also be specified using a named time zone, using the names from the IANA time zone database. This may be provided either in addition to, or in place of the offset. The named time zone is given last and is enclosed in square brackets ([ ]). Should both the offset and the named time zone be provided, the offset must match the named time zone.

The following formats are supported for specifying time zones:

<table>
<thead>
<tr>
<th>Format</th>
<th>Description</th>
<th>Example</th>
<th>Supported for DateTime</th>
<th>Supported for Time</th>
</tr>
</thead>
<tbody>
<tr>
<td>Z</td>
<td>UTC</td>

<td></td>
</tr>
<tr>
<td>[ZoneName]</td>
<td>[ZoneName]</td>
<td>[America/Regina]</td>
<td>✓</td>
<td></td>
</tr>
</tbody>
</table>

Examples

We show below examples of parsing temporal instant values using various formats. For more details, refer to An overview of temporal instant type creation.

Parsing a DateTime using the calendar date format:

Query

```
RETURN datetime('2015-06-24T12:50:35.556+0100') AS theDateTime
```

Table 33. Result

<table>
<thead>
<tr>
<th>theDateTime</th>
</tr>
</thead>
<tbody>
<tr>
<td>2015-06-24T12:50:35.556+01:00</td>
</tr>
</tbody>
</table>

Rows: 1

Parsing a LocalDateTime using the ordinal date format:

Query

```
RETURN localdatetime('2015185T19:32:24') AS theLocalDateTime
```

Table 34. Result
Parsing a Date using the week date format:

Query

```
RETURN date('+2015-W13-4') AS theDate
```

Table 35. Result

<table>
<thead>
<tr>
<th>theDate</th>
</tr>
</thead>
<tbody>
<tr>
<td>2015-03-26</td>
</tr>
</tbody>
</table>

Rows: 1

Parsing a Time:

Query

```
RETURN time('125035.556+0100') AS theTime
```

Table 36. Result

<table>
<thead>
<tr>
<th>theTime</th>
</tr>
</thead>
<tbody>
<tr>
<td>12:50:35.556+01:00</td>
</tr>
</tbody>
</table>

Rows: 1

Parsing a LocalTime:

Query

```
RETURN localtime('12:50:35.556') AS theLocalTime
```

Table 37. Result

<table>
<thead>
<tr>
<th>theLocalTime</th>
</tr>
</thead>
<tbody>
<tr>
<td>12:50:35.556</td>
</tr>
</tbody>
</table>

Rows: 1

Accessing components of temporal instants

Components of temporal instant values can be accessed as properties.

Table 38. Components of temporal instant values and where they are supported

8.9.3. Durations

Specifying durations

A Duration represents a temporal amount, capturing the difference in time between two instants, and can be negative.

The specification of a Duration is prefixed with a `P`, and can use either a unit-based form or a date-and-time-based form:

- **Unit-based form:** `P[nY][nM][nW][nD][T[nH][nM][nS]]`
  - The square brackets `[ ]` denote an optional component (components with a zero value may be omitted).
  - The `n` denotes a numeric value which can be arbitrarily large.
  - The value of the last — and least significant — component may contain a decimal fraction.
  - Each component must be suffixed by a component identifier denoting the unit.
  - The unit-based form uses `M` as a suffix for both months and minutes. Therefore, time parts must always be preceded with `T`, even when no components of the date part are given.

- **Date-and-time-based form:** `P<date>T<time>`.  
  - Unlike the unit-based form, this form requires each component to be within the bounds of a valid LocalDateTime.

The following table lists the component identifiers for the unit-based form:

<table>
<thead>
<tr>
<th>Component identifier</th>
<th>Description</th>
<th>Comments</th>
</tr>
</thead>
<tbody>
<tr>
<td>Y</td>
<td>Years</td>
<td></td>
</tr>
<tr>
<td>M</td>
<td>Months</td>
<td>Must be specified before T.</td>
</tr>
<tr>
<td>W</td>
<td>Weeks</td>
<td></td>
</tr>
<tr>
<td>D</td>
<td>Days</td>
<td></td>
</tr>
<tr>
<td>H</td>
<td>Hours</td>
<td></td>
</tr>
<tr>
<td>M</td>
<td>Minutes</td>
<td>Must be specified after T.</td>
</tr>
<tr>
<td>S</td>
<td>Seconds</td>
<td></td>
</tr>
</tbody>
</table>

Examples

The following examples demonstrate various methods of parsing Duration values. For more details, refer
to Creating a Duration from a string.

Return a Duration of 14 days, 16 hours and 12 minutes:

Query

```
RETURN duration('P14DT16H12M') AS theDuration
```

Table 43. Result

<table>
<thead>
<tr>
<th>theDuration</th>
</tr>
</thead>
<tbody>
<tr>
<td>P14DT16H12M</td>
</tr>
<tr>
<td>Rows: 1</td>
</tr>
</tbody>
</table>

Return a Duration of 5 months, 1 day and 12 hours:

Query

```
RETURN duration('P5M1.5D') AS theDuration
```

Table 44. Result

<table>
<thead>
<tr>
<th>theDuration</th>
</tr>
</thead>
<tbody>
<tr>
<td>P5M1DT12H</td>
</tr>
<tr>
<td>Rows: 1</td>
</tr>
</tbody>
</table>

Return a Duration of 45 seconds:

Query

```
RETURN duration('PT0.75M') AS theDuration
```

Table 45. Result

<table>
<thead>
<tr>
<th>theDuration</th>
</tr>
</thead>
<tbody>
<tr>
<td>PT45S</td>
</tr>
<tr>
<td>Rows: 1</td>
</tr>
</tbody>
</table>

Return a Duration of 2 weeks, 3 days and 12 hours:

Query

```
RETURN duration('P2.5W') AS theDuration
```

Table 46. Result

<table>
<thead>
<tr>
<th>theDuration</th>
</tr>
</thead>
<tbody>
<tr>
<td>P17DT12H</td>
</tr>
<tr>
<td>Rows: 1</td>
</tr>
</tbody>
</table>
Accessing components of durations

A Duration can have several components, each categorized into Months, Days, and Seconds groups.

Components of Duration values are truncated within their component groups as follows:

<table>
<thead>
<tr>
<th>Component Group</th>
<th>Component</th>
<th>Description</th>
<th>Type</th>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td>Months</td>
<td>duration.years</td>
<td>The total number of years</td>
<td>Integer</td>
<td>Each set of 4 quarters is counted as 1 year; each set of 12 months is counted as 1 year.</td>
</tr>
<tr>
<td></td>
<td>duration.quarters</td>
<td>The total number of quarters</td>
<td>Integer</td>
<td>Each year is counted as 4 quarters; each set of 3 months is counted as 1 quarter.</td>
</tr>
<tr>
<td></td>
<td>duration.months</td>
<td>The total number of months</td>
<td>Integer</td>
<td>Each year is counted as 12 months; eachQuarter_ is counted as 3 months.</td>
</tr>
<tr>
<td>Days</td>
<td>duration.weeks</td>
<td>The total number of weeks</td>
<td>Integer</td>
<td>Each set of 7 days is counted as 1 week.</td>
</tr>
<tr>
<td></td>
<td>duration.days</td>
<td>The total number of days</td>
<td>Integer</td>
<td>Each week is counted as 7 days.</td>
</tr>
<tr>
<td>Seconds</td>
<td>duration.hours</td>
<td>The total number of hours</td>
<td>Integer</td>
<td>Each set of 60 minutes is counted as 1 hour; each set of 3600 seconds is counted as 1 hour.</td>
</tr>
<tr>
<td></td>
<td>duration.minutes</td>
<td>The total number of minutes</td>
<td>Integer</td>
<td>Each hour is counted as 60 minutes; each set of 60 seconds is counted as 1 minute.</td>
</tr>
<tr>
<td></td>
<td>duration.seconds</td>
<td>The total number of seconds</td>
<td>Integer</td>
<td>Each hour is counted as 3600 seconds; each minute is counted as 60 seconds.</td>
</tr>
<tr>
<td></td>
<td>duration.milliseconds</td>
<td>The total number of milliseconds</td>
<td>Integer</td>
<td>Each set of 1000 milliseconds is counted as 1 second.</td>
</tr>
<tr>
<td></td>
<td>duration.microseconds</td>
<td>The total number of microseconds</td>
<td>Integer</td>
<td>Each millisecond is counted as 1000 microseconds.</td>
</tr>
<tr>
<td></td>
<td>duration.nanoseconds</td>
<td>The total number of nanoseconds</td>
<td>Integer</td>
<td>Each microsecond is counted as 1000 nanoseconds.</td>
</tr>
</tbody>
</table>

Please note that:

- Cypher uses UTC-SLS when handling leap seconds.
- There are not always 24 hours in 1 day; when switching to/from daylight savings time, a day can have 23 or 25 hours.
- There are not always the same number of days in a month.
- Due to leap years, there are not always the same number of days in a year.
It is also possible to access the smaller (less significant) components of a component group bounded by the largest (most significant) component of the group:

<table>
<thead>
<tr>
<th>Component</th>
<th>Component Group</th>
<th>Description</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>duration.quartersOfYear</td>
<td>Months</td>
<td>The number of quarters in the group that do not make a whole year</td>
<td>Integer</td>
</tr>
<tr>
<td>duration.monthsOfYear</td>
<td>Months</td>
<td>The number of months in the group that do not make a whole year</td>
<td>Integer</td>
</tr>
<tr>
<td>duration.monthsOfQuarter</td>
<td>Months</td>
<td>The number of months in the group that do not make a whole quarter</td>
<td>Integer</td>
</tr>
<tr>
<td>duration.daysOfWeek</td>
<td>Days</td>
<td>The number of days in the group that do not make a whole week</td>
<td>Integer</td>
</tr>
<tr>
<td>duration.minutesOfHour</td>
<td>Seconds</td>
<td>The number of minutes in the group that do not make a whole hour</td>
<td>Integer</td>
</tr>
<tr>
<td>duration.secondsOfMinute</td>
<td>Seconds</td>
<td>The number of seconds in the group that do not make a whole minute</td>
<td>Integer</td>
</tr>
<tr>
<td>duration.millisecondsOfSecond</td>
<td>Seconds</td>
<td>The number of milliseconds in the group that do not make a whole second</td>
<td>Integer</td>
</tr>
<tr>
<td>duration.microsecondsOfSecond</td>
<td>Seconds</td>
<td>The number of microseconds in the group that do not make a whole second</td>
<td>Integer</td>
</tr>
<tr>
<td>duration.nanosecondsOfSecond</td>
<td>Seconds</td>
<td>The number of nanoseconds in the group that do not make a whole second</td>
<td>Integer</td>
</tr>
</tbody>
</table>

The following query shows how to extract the month based components of a Duration value:

**Query**

```
WITH duration({years: 1, months: 5, days: 111, minutes: 42}) AS d
RETURN d.years, d.quarters, d.quartersOfYear, d.months, d.monthsOfYear, d.monthsOfQuarter
```

**Table 47. Result**

<table>
<thead>
<tr>
<th>d.years</th>
<th>d.quarters</th>
<th>d.quartersOfYear</th>
<th>d.months</th>
<th>d.monthsOfYear</th>
<th>d.monthsOfQuarter</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>5</td>
<td>1</td>
<td>17</td>
<td>5</td>
<td>2</td>
</tr>
</tbody>
</table>

Rows: 1

The following query shows how to extract the day based components of a Duration value:

**Query**

```
WITH duration({months: 5, days: 25, hours: 1}) AS d
RETURN d.weeks, d.days, d.daysOfWeek
```

**Table 48. Result**
The following query shows how to extract the most significant second based components of a Duration value:

**Query**

```sql
WITH duration({
  years: 1, months: 1, days: 1, hours: 1, minutes: 1, seconds: 1, nanoseconds: 111111111
}) AS d
RETURN d.hours, d.minutes, d.seconds, d.milliseconds, d.microseconds, d.nanoseconds
```

**Table 49. Result**

<table>
<thead>
<tr>
<th>d.hours</th>
<th>d.minutes</th>
<th>d.seconds</th>
<th>d.milliseconds</th>
<th>d.microseconds</th>
<th>d.nanoseconds</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>61</td>
<td>3661</td>
<td>3661111</td>
<td>3661111111</td>
<td>3661111111111</td>
</tr>
</tbody>
</table>

Rows: 1

The following query shows how to extract the less significant second based components of a Duration value:

**Query**

```sql
WITH duration({
  years: 1, months: 1, days: 1, hours: 1, minutes: 1, seconds: 1, nanoseconds: 111111111
}) AS d
RETURN d.minutesOfHour, d.secondsOfMinute, d.millisecondsOfSecond, d.microsecondsOfSecond, d.nanosecondsOfSecond
```

**Table 50. Result**

<table>
<thead>
<tr>
<th>d.minutesOfHour</th>
<th>d.secondsOfMinute</th>
<th>d.millisecondsOfSecond</th>
<th>d.microsecondsOfSecond</th>
<th>d.nanosecondsOfSecond</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>1</td>
<td>111</td>
<td>11111</td>
<td>111111111</td>
</tr>
</tbody>
</table>

Rows: 1

### 8.9.4. Examples

The following examples illustrate the use of some of the temporal functions and operators. Refer to **Temporal functions - instant types** and **Temporal operators** for more details.

Create a Duration representing 1.5 days:

**Query**

```sql
RETURN duration({
  days: 1, hours: 12
}) AS theDuration
```
Table 51. Result

<table>
<thead>
<tr>
<th>theDuration</th>
</tr>
</thead>
<tbody>
<tr>
<td>P1DT12H</td>
</tr>
</tbody>
</table>

Rows: 1

Compute the Duration between two temporal instants:

Query

```sql
RETURN duration.between(date('1984-10-11'), date('2015-06-24')) AS theDuration
```

Table 52. Result

<table>
<thead>
<tr>
<th>theDuration</th>
</tr>
</thead>
<tbody>
<tr>
<td>P30Y8M13D</td>
</tr>
</tbody>
</table>

Rows: 1

Compute the number of days between two Date values:

Query

```sql
RETURN duration.inDays(date('2014-10-11'), date('2015-08-06')) AS theDuration
```

Table 53. Result

<table>
<thead>
<tr>
<th>theDuration</th>
</tr>
</thead>
<tbody>
<tr>
<td>P299D</td>
</tr>
</tbody>
</table>

Rows: 1

Get the first Date of the current year:

Query

```sql
RETURN date.truncate('year') AS day
```

Table 54. Result

<table>
<thead>
<tr>
<th>day</th>
</tr>
</thead>
<tbody>
<tr>
<td>2022-01-01</td>
</tr>
</tbody>
</table>

Rows: 1

Get the Date of the Thursday in the week of a specific date:

Query

```sql
RETURN date.truncate('week', date('2019-10-01'), {dayOfWeek: 4}) AS thursday
```

Table 55. Result
Get the Date of the last day of the next month:

Query

```sql
RETURN date.truncate('month', date()) + duration('P2M') - duration('P1D') AS lastDay
```

Table 56. Result

<table>
<thead>
<tr>
<th>lastDay</th>
</tr>
</thead>
<tbody>
<tr>
<td>2022-09-30</td>
</tr>
</tbody>
</table>

Add a Duration to a Date:

Query

```sql
RETURN time('13:42:19') + duration({days: 1, hours: 12}) AS theTime
```

Table 57. Result

<table>
<thead>
<tr>
<th>theTime</th>
</tr>
</thead>
<tbody>
<tr>
<td>01:42:19Z</td>
</tr>
</tbody>
</table>

Add two Duration values:

Query

```sql
RETURN duration({days: 2, hours: 7}) + duration({months: 1, hours: 18}) AS theDuration
```

Table 58. Result

<table>
<thead>
<tr>
<th>theDuration</th>
</tr>
</thead>
<tbody>
<tr>
<td>P1M2DT25H</td>
</tr>
</tbody>
</table>

Multiply a Duration by a number:

Query

```sql
RETURN duration({hours: 5, minutes: 21}) * 14 AS theDuration
```

Table 59. Result
Divide a Duration by a number:

Query

```
RETURN duration((hours: 3, minutes: 16)) / 2 AS theDuration
```

Table 60. Result

<table>
<thead>
<tr>
<th>theDuration</th>
</tr>
</thead>
<tbody>
<tr>
<td>PT1H38M</td>
</tr>
</tbody>
</table>

Examine whether two instants are less than one day apart:

Query

```
WITH
datetime('2015-07-21T21:40:32.142+0100') AS date1,
datetime('2015-07-21T17:12:56.333+0100') AS date2
RETURN
CASE
    WHEN date1 < date2 THEN date1 + duration("P1D") > date2
    ELSE date2 + duration("P1D") > date1
END AS lessThanOneDayApart
```

Table 61. Result

<table>
<thead>
<tr>
<th>lessThanOneDayApart</th>
</tr>
</thead>
<tbody>
<tr>
<td>true</td>
</tr>
</tbody>
</table>

Return the abbreviated name of the current month:

Query

```
RETURN [
][date().month - 1] AS month
```

Table 62. Result

<table>
<thead>
<tr>
<th>month</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;Aug&quot;</td>
</tr>
</tbody>
</table>

Rows: 1
8.9.5. Temporal indexing

All temporal types can be indexed, and thereby support exact lookups for equality predicates. Indexes for temporal instant types additionally support range lookups.

8.10. Spatial values

Cypher has built-in support for handling spatial values (points), and the underlying database supports storing these point values as properties on nodes and relationships.

- Introduction
- Coordinate Reference Systems
  - Geographic coordinate reference systems
  - Cartesian coordinate reference systems
- Spatial instants
  - Creating points
  - Accessing components of points
- Spatial index
- Comparability and Orderability

Refer to Spatial functions for information regarding spatial functions allowing for the creation and manipulation of spatial values.

Refer to Ordering and comparison of values for information regarding the comparison and ordering of spatial values.

8.10.1. Introduction

Neo4j supports only one type of spatial geometry, the Point with the following characteristics:

- Each point can have either 2 or 3 dimensions. This means it contains either 2 or 3 64-bit floating point values, which together are called the Coordinate.
- Each point will also be associated with a specific Coordinate Reference System (CRS) that determines the meaning of the values in the Coordinate.
- Instances of Point and lists of Point can be assigned to node and relationship properties.
- Nodes with Point or List(Point) properties can be indexed using a spatial index. This is true for all CRS (and for both 2D and 3D). There is no special syntax for creating spatial indexes, as it is supported using the existing indexes.
- The distance function will work on points in all CRS and in both 2D and 3D but only if the two points have the same CRS (and therefore also same dimension).
8.10.2. Coordinate Reference Systems

Four Coordinate Reference Systems (CRS) are supported, each of which falls within one of two types: geographic coordinates modeling points on the earth, or cartesian coordinates modeling points in euclidean space:

- **Geographic coordinate reference systems**
  - WGS-84: longitude, latitude (x, y)
  - WGS-84-3D: longitude, latitude, height (x, y, z)
- **Cartesian coordinate reference systems**
  - Cartesian: x, y
  - Cartesian 3D: x, y, z

Data within different coordinate systems are entirely incomparable, and cannot be implicitly converted from one to the other. This is true even if they are both cartesian or both geographic. For example, if you search for 3D points using a 2D range, you will get no results. However, they can be ordered, as discussed in more detail in Ordering and comparison of values.

Geographic coordinate reference systems

Two Geographic Coordinate Reference Systems (CRS) are supported, modeling points on the earth:

- **WGS 84 2D**
  - A 2D geographic point in the WGS 84 CRS is specified in one of two ways:
    - longitude and latitude (if these are specified, and the crs is not, then the crs is assumed to be WGS-84)
    - x and y (in this case the crs must be specified, or will be assumed to be Cartesian)
  - Specifying this CRS can be done using either the name 'wgs-84' or the SRID 4326 as described in Point(WGS-84)
- **WGS 84 3D**
  - A 3D geographic point in the WGS 84 CRS is specified one of in two ways:
    - longitude, latitude and either height or z (if these are specified, and the crs is not, then the crs is assumed to be WGS-84-3D)
    - x, y and z (in this case the crs must be specified, or will be assumed to be Cartesian-3D)
  - Specifying this CRS can be done using either the name 'wgs-84-3d' or the SRID 4979 as described in Point(WGS-84-3D)

The units of the latitude and longitude fields are in decimal degrees, and need to be specified as floating point numbers using Cypher literals. It is not possible to use any other format, like 'degrees, minutes, seconds'. The units of the height field are in meters. When geographic points are passed to the distance function, the result will always be in meters. If the coordinates are in any other format or unit than supported, it is necessary to explicitly convert them. For example, if the incoming $height is a string field in kilometers, you would need to type height: toFloat($height) * 1000. Likewise if the results of the
distance function are expected to be returned in kilometers, an explicit conversion is required. For example: \( \text{RETURN distance(a,b) / 1000 AS km} \). An example demonstrating conversion on incoming and outgoing values is:

\[
\text{Query}
\]

\[
\text{WITH}
\]
\[
\text{point(}}\{\text{latitude:toFloat('13.43')}, \text{longitude:toFloat('56.21')}\}\text{ AS p1,}
\text{point(}}\{\text{latitude:toFloat('13.10')}, \text{longitude:toFloat('56.41')}\}\text{ AS p2}
\]
\[
\text{RETURN toInteger(}}\text{distance(p1, p2)/1000}\text{ AS km}
\]

<table>
<thead>
<tr>
<th>km</th>
<th>42</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Rows: 1

Table 63. Result

Cartesian coordinate reference systems

Two Cartesian Coordinate Reference Systems (CRS) are supported, modeling points in euclidean space:

- **Cartesian 2D**
  - A 2D point in the Cartesian CRS is specified with a map containing \( x \) and \( y \) coordinate values
  - Specifying this CRS can be done using either the name 'cartesian' or the SRID 7203 as described in \texttt{Point(Cartesian)}

- **Cartesian 3D**
  - A 3D point in the Cartesian CRS is specified with a map containing \( x \), \( y \) and \( z \) coordinate values
  - Specifying this CRS can be done using either the name 'cartesian-3d' or the SRID 9157 as described in \texttt{Point(Cartesian-3D)}

The units of the \( x \), \( y \) and \( z \) fields are unspecified and can mean anything the user intends them to mean. This also means that when two cartesian points are passed to the distance function, the resulting value will be in the same units as the original coordinates. This is true for both 2D and 3D points, as the pythagoras equation used is generalized to any number of dimensions. However, just as you cannot compare geographic points to cartesian points, you cannot calculate the distance between a 2D point and a 3D point. If you need to do that, explicitly transform the one type into the other. For example:

\[
\text{Query}
\]

\[
\text{WITH}
\]
\[
\text{point(}}\{\text{x: 3, y: 0}\}\text{ AS p2d,}
\text{point(}}\{\text{x: 0, y: 4, z: 1}\}\text{ AS p3d}
\]
\[
\text{RETURN distance(p2d, p3d) AS bad,}
\text{distance(p2d, point(}}\{\text{x: p3d.x, y: p3d.y})\text{ AS good}
\]

<table>
<thead>
<tr>
<th>bad</th>
<th>good</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;null&gt;</td>
<td>5.0</td>
</tr>
</tbody>
</table>

Table 64. Result
8.10.3. Spatial instants

Creating points

All point types are created from two components:

- The Coordinate containing either 2 or 3 floating point values (64-bit)
- The Coordinate Reference System (or CRS) defining the meaning (and possibly units) of the values in the Coordinate

For most use cases it is not necessary to specify the CRS explicitly as it will be deduced from the keys used to specify the coordinate. Two rules are applied to deduce the CRS from the coordinate:

- Choice of keys:
  - If the coordinate is specified using the keys latitude and longitude the CRS will be assumed to be Geographic and therefor either WGS-84 or WGS-84-3D.
  - If instead x and y are used, then the default CRS would be Cartesian or Cartesian-3D
- Number of dimensions:
  - If there are 2 dimensions in the coordinate, x & y or longitude & latitude the CRS will be a 2D CRS
  - If there is a third dimensions in the coordinate, z or height the CRS will be a 3D CRS

All fields are provided to the point function in the form of a map of explicitly named arguments. We specifically do not support an ordered list of coordinate fields because of the contradictory conventions between geographic and cartesian coordinates, where geographic coordinates normally list y before x (latitude before longitude). See for example the following query which returns points created in each of the four supported CRS. Take particular note of the order and keys of the coordinates in the original point function calls, and how those values are displayed in the results:

Query

```sql
RETURN
point({x: 3.0, y: 0.0, crs: 'cartesian'}) AS cartesian_2d,
point({x: 0.0, y: 4.0, z: 1.0, crs: 'cartesian-3d'}) AS cartesian_3d,
point({latitude: 12, longitude: 56}) AS geo_2d,

</tr>
</tbody>
</table>

Rows: 1
For the geographic coordinates, it is important to note that the \texttt{latitude} value should always lie in the interval \([-90, 90]\) and any other value outside this range will throw an exception. The \texttt{longitude} value should always lie in the interval \([-180, 180]\) and any other value outside this range will be wrapped around to fit in this range. The \texttt{height} value and any cartesian coordinates are not explicitly restricted, and any value within the allowed range of the signed 64-bit floating point type will be accepted.

Accessing components of points

Just as we construct points using a map syntax, we can also access components as properties of the instance.

Table 66. Components of point instances and where they are supported

Rows: 1

The following query shows how to extract the components of a WGS-84 3D point value:

**Query**

```sql
WITH point({latitude: 3, longitude: 4, height: 4321}) AS p
RETURN
  p.latitude AS latitude,
  p.longitude AS longitude,
  p.height AS height,
  p.x AS x,
  p.y AS y,
  p.z AS z,
  p.crs AS crs,
  p.srid AS srid
```

**Table 68. Result**

80
8.10.4. Spatial index

If there is an index on a particular :Label(property) combination, and a spatial point is assigned to that property on a node with that label, the node will be indexed in a spatial index. For spatial indexing, Neo4j uses space filling curves in 2D or 3D over an underlying generalized B+Tree. Points will be stored in up to four different trees, one for each of the four coordinate reference systems. This allows for both equality and range queries using exactly the same syntax and behaviour as for other property types. If two range predicates are used, which define minimum and maximum points, this will effectively result in a bounding box query. In addition, queries using the distance function can, under the right conditions, also use the index, as described in the section 'Spatial distance searches'.

8.10.5. Comparability and Orderability

Points with different CRS are not comparable. This means that any function operating on two points of different types will return null. This is true of the distance function as well as inequality comparisons. If these are used in a predicate, they will cause the associated MATCH to return no results.

Query

```
WITH point({x: 3, y: 0}) AS p2d,
    point({x: 0, y: 4, z: 1}) AS p3d
RETURN
    distance(p2d, p3d),
    p2d < p3d,
    p2d = p3d,
    p2d <> p3d,
    distance(p2d, point({x: p3d.x, y: p3d.y}))
```

Table 69. Result

<table>
<thead>
<tr>
<th>distance(p2d, p3d)</th>
<th>p2d &lt; p3d</th>
<th>p2d = p3d</th>
<th>p2d &lt;&gt; p3d</th>
<th>distance(p2d, point({x: p3d.x, y: p3d.y}))</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;null&gt;</td>
<td>&lt;null&gt;</td>
<td>false</td>
<td>true</td>
<td>5.0</td>
</tr>
</tbody>
</table>

Rows: 1

However, all types are orderable. The Point types will be ordered after Numbers and before Temporal types. Points with different CRS will be ordered by their SRID numbers. For the current set of four CRS, this means the order is WGS84, WGS84-3D, Cartesian, Cartesian-3D.
Query

```cypher
UNWIND [
  point({x: 3, y: 0}),
  point({x: 0, y: 4, z: 1}),
  point({srid: 4326, x: 12, y: 56}),
  point({srid: 4979, x: 12, y: 56, z: 1000})
] AS point
RETURN point ORDER BY point
```

Table 70. Result

<table>
<thead>
<tr>
<th>point</th>
</tr>
</thead>
<tbody>
<tr>
<td>point({x: 12.0, y: 56.0, crs: 'wgs-84'})</td>
</tr>
<tr>
<td>point({x: 12.0, y: 56.0, z: 1000.0, crs: 'wgs-84-3d'})</td>
</tr>
<tr>
<td>point({x: 3.0, y: 0.0, crs: 'cartesian'})</td>
</tr>
<tr>
<td>point({x: 0.0, y: 4.0, z: 1.0, crs: 'cartesian-3d'})</td>
</tr>
</tbody>
</table>

Rows: 4

8.11. Lists

Cypher has comprehensive support for lists.

- Lists in general
- List comprehension
- Pattern comprehension

Information regarding operators, such as list concatenation (+), element existence checking (IN), and access ([ ]) can be found here. The behavior of the `IN` and `[ ]` operators with respect to `null` is detailed here.

8.11.1. Lists in general

A literal list is created by using brackets and separating the elements in the list with commas.

Query

```
RETURN [0, 1, 2, 3, 4, 5, 6, 7, 8, 9] AS list
```

Table 71. Result

<table>
<thead>
<tr>
<th>list</th>
</tr>
</thead>
<tbody>
<tr>
<td>[0,1,2,3,4,5,6,7,8,9]</td>
</tr>
</tbody>
</table>

Rows: 1

In the examples, you use the `range` function. It gives you a list containing all numbers between given start and end numbers. Range is inclusive in both ends.
To access individual elements in the list, you can use the square brackets again. This extracts from the start index and up to, but not including, the end index.

**Query**

```
RETURN range(0, 10)[3]
```

**Table 72. Result**

<table>
<thead>
<tr>
<th>range(0, 10)[3]</th>
<th>3</th>
</tr>
</thead>
<tbody>
<tr>
<td>Rows: 1</td>
<td></td>
</tr>
</tbody>
</table>

You can also use negative numbers, to start from the end of the list instead.

**Query**

```
RETURN range(0, 10)[-3]
```

**Table 73. Result**

<table>
<thead>
<tr>
<th>range(0, 10)[-3]</th>
<th>8</th>
</tr>
</thead>
<tbody>
<tr>
<td>Rows: 1</td>
<td></td>
</tr>
</tbody>
</table>

Finally, you can use ranges inside the brackets to return ranges of the list.

**Query**

```
RETURN range(0, 10)[0..3]
```

**Table 74. Result**

<table>
<thead>
<tr>
<th>range(0, 10)[0..3]</th>
<th>[0,1,2]</th>
</tr>
</thead>
<tbody>
<tr>
<td>Rows: 1</td>
<td></td>
</tr>
</tbody>
</table>

**Query**

```
RETURN range(0, 10)[0..-5]
```

**Table 75. Result**

<table>
<thead>
<tr>
<th>range(0, 10)[0..-5]</th>
<th>[0,1,2,3,4,5]</th>
</tr>
</thead>
<tbody>
<tr>
<td>Rows: 1</td>
<td></td>
</tr>
</tbody>
</table>
You can get the size of a list as follows:

```
Query
RETURN size(range(0, 10)[0..3])
```
8.11.2. List comprehension

List comprehension is a syntactic construct available in Cypher for creating a list based on existing lists. It follows the form of the mathematical set-builder notation (set comprehension) instead of the use of map and filter functions.

Query

```
RETURN [x IN range(0, 10) WHERE x % 2 = 0 | x^3] AS result
```

Table 81. Result

<table>
<thead>
<tr>
<th>result</th>
</tr>
</thead>
<tbody>
<tr>
<td>[0.0, 8.0, 64.0, 216.0, 512.0, 1000.0]</td>
</tr>
</tbody>
</table>

Rows: 1

Either the WHERE part, or the expression, can be omitted, if you only want to filter or map respectively.

Query

```
RETURN [x IN range(0, 10) WHERE x % 2 = 0] AS result
```

Table 82. Result

<table>
<thead>
<tr>
<th>result</th>
</tr>
</thead>
<tbody>
<tr>
<td>[0, 2, 4, 6, 8, 10]</td>
</tr>
</tbody>
</table>

Rows: 1

Query

```
RETURN [x IN range(0, 10) | x^3] AS result
```

Table 83. Result

<table>
<thead>
<tr>
<th>result</th>
</tr>
</thead>
<tbody>
<tr>
<td>[0.0, 1.0, 8.0, 27.0, 64.0, 125.0, 216.0, 343.0, 512.0, 729.0, 1000.0]</td>
</tr>
</tbody>
</table>

Rows: 1

8.11.3. Pattern comprehension

Pattern comprehension is a syntactic construct available in Cypher for creating a list based on matchings of a pattern. A pattern comprehension matches the specified pattern like a normal MATCH clause, with
predicates like a normal WHERE clause, but yields a custom projection as specified.

The following graph is used for the pattern comprehension examples:

```
Graph
```

This example returns a list that contains the year when the movies was released. The pattern matching in the pattern comprehension looks for Matrix in the movie title and that the node a (Person node with the name Keanu Reeves) has a relationship with the movie.

Query

```
MATCH (a:Person {name: 'Keanu Reeves'})
RETURN [(a)-->[b:Movie] WHERE b.title CONTAINS 'Matrix' | b.released] AS years
```

Table 84. Result

<table>
<thead>
<tr>
<th>years</th>
</tr>
</thead>
</table>

Rows: 1

The whole predicate, including the WHERE keyword, is optional and may be omitted.

This example returns a sorted list that contains years. The pattern matching in the pattern comprehension looks for movie nodes that has a relationship with the node a (Person node with the name Keanu Reeves).

Query

```
MATCH (a:Person {name: 'Keanu Reeves'})
WITH [(a)-->[b:Movie] | b.released] AS years
UNWIND years AS year
WITH year ORDER BY year
RETURN COLLECT(year) AS sorted_years
```

Table 85. Result

<table>
<thead>
<tr>
<th>sorted_years</th>
</tr>
</thead>
</table>

Rows: 1

8.12. Maps

This section describes how to use maps in Cyphers.

- Literal maps
- Map projection
  - Examples of map projection
The following graph is used for the examples below:

Graph

Information regarding property access operators such as . and [] can be found here. The behavior of the [] operator with respect to null is detailed here.

8.12.1. Literal maps

Cypher supports construction of maps. The key names in a map must be of type String. If returned through an HTTP API call, a JSON object will be returned. If returned in Java, an object of type java.util.Map<String, Object> will be returned.

Query

```
RETURN {key: 'Value', listKey: [[inner: 'Map1'], [inner: 'Map2']])
```

Table 86. Result

```
{key: 'Value', listKey: [[inner: 'Map1'], [inner: 'Map2']])
```

```
{listKey -> [[inner -> "Map1"],{inner -> "Map2"}], key -> "Value")
```

Rows: 1

8.12.2. Map projection

Cypher supports a concept called "map projections". It allows for easily constructing map projections from nodes, relationships and other map values.

A map projection begins with the variable bound to the graph entity to be projected from, and contains a body of comma-separated map elements, enclosed by { and }.

```
map_variable {map_element, [, ...n]}
```

A map element projects one or more key-value pairs to the map projection. There exist four different types of map projection elements:

- Property selector - Projects the property name as the key, and the value from the map_variable as the value for the projection.
- Literal entry - This is a key-value pair, with the value being arbitrary expression key: <expression>.
- Variable selector - Projects a variable, with the variable name as the key, and the value the variable is pointing to as the value of the projection. Its syntax is just the variable.
• All-properties selector - projects all key-value pairs from the `map_variable` value.

The following conditions apply:

• If the `map_variable` points to a `null` value, the whole map projection will evaluate to `null`.
• The key names in a map must be of type `String`.

Examples of map projections

Find 'Charlie Sheen' and return data about him and the movies he has acted in. This example shows an example of map projection with a literal entry, which in turn also uses map projection inside the aggregating `collect()`.

Query

```
MATCH (actor:Person {name: 'Charlie Sheen'})-[[:ACTED_IN]]->(movie:Movie)
RETURN actor {.name, .realName, movies: collect(movie{.title, .year})}
```

Table 87. Result

<table>
<thead>
<tr>
<th>actor</th>
</tr>
</thead>
</table>

Rows: 1

Find all persons that have acted in movies, and show number for each. This example introduces an variable with the count, and uses a variable selector to project the value.

Query

```
MATCH (actor:Person)-[:ACTED_IN]->(movie:Movie)
WITH actor, count (movie) AS nbrOfMovies
RETURN actor {.name, nbrOfMovies}
```

Table 88. Result

<table>
<thead>
<tr>
<th>actor</th>
</tr>
</thead>
<tbody>
<tr>
<td>{nbrOfMovies -&gt; 2, name -&gt; &quot;Martin Sheen&quot;}</td>
</tr>
<tr>
<td>{nbrOfMovies -&gt; 3, name -&gt; &quot;Charlie Sheen&quot;}</td>
</tr>
</tbody>
</table>

Rows: 2

Again, focusing on 'Charlie Sheen', this time returning all properties from the node. Here we use an all-properties selector to project all the node properties, and additionally, explicitly project the property `age`. Since this property does not exist on the node, a `null` value is projected instead.

Query

```
MATCH (actor:Person {name: 'Charlie Sheen'})
RETURN actor {.*, .age}
```

Table 89. Result
8.13. Working with \texttt{null}

This section describes working with the \texttt{null} value.

- Introduction to \texttt{null} in Cypher
- Logical operations with \texttt{null}
- The \texttt{IN} operator and \texttt{null}
- The \texttt{\[] operator and \texttt{null}
- Expressions that return \texttt{null}

8.13.1. Introduction to \texttt{null} in Cypher

In Cypher, \texttt{null} is used to represent missing or undefined values. Conceptually, \texttt{null} means a missing unknown value and it is treated somewhat differently from other values. For example getting a property from a node that does not have said property produces \texttt{null}. Most expressions that take \texttt{null} as input will produce \texttt{null}. This includes boolean expressions that are used as predicates in the \texttt{WHERE} clause. In this case, anything that is not \texttt{true} is interpreted as being false.

\texttt{null} is not equal to \texttt{null}. Not knowing two values does not imply that they are the same value. So the expression \texttt{null = null} yields \texttt{null} and not \texttt{true}.

8.13.2. Logical operations with \texttt{null}

The logical operators (\texttt{AND}, \texttt{OR}, \texttt{XOR}, \texttt{NOT}) treat \texttt{null} as the unknown value of three-valued logic.

Here is the truth table for \texttt{AND}, \texttt{OR}, \texttt{XOR} and \texttt{NOT}.

<table>
<thead>
<tr>
<th>a</th>
<th>b</th>
<th>a \texttt{AND} b</th>
<th>a \texttt{OR} b</th>
<th>a \texttt{XOR} b</th>
<th>\texttt{NOT} a</th>
</tr>
</thead>
<tbody>
<tr>
<td>false</td>
<td>false</td>
<td>false</td>
<td>false</td>
<td>false</td>
<td>true</td>
</tr>
<tr>
<td>false</td>
<td>null</td>
<td>false</td>
<td>null</td>
<td>null</td>
<td>true</td>
</tr>
<tr>
<td>false</td>
<td>true</td>
<td>false</td>
<td>true</td>
<td>true</td>
<td>true</td>
</tr>
<tr>
<td>true</td>
<td>false</td>
<td>false</td>
<td>true</td>
<td>true</td>
<td>false</td>
</tr>
<tr>
<td>true</td>
<td>null</td>
<td>null</td>
<td>true</td>
<td>null</td>
<td>false</td>
</tr>
<tr>
<td>true</td>
<td>true</td>
<td>true</td>
<td>true</td>
<td>false</td>
<td>false</td>
</tr>
<tr>
<td>null</td>
<td>false</td>
<td>false</td>
<td>null</td>
<td>null</td>
<td>null</td>
</tr>
<tr>
<td>null</td>
<td>null</td>
<td>null</td>
<td>null</td>
<td>null</td>
<td>null</td>
</tr>
<tr>
<td>null</td>
<td>true</td>
<td>null</td>
<td>true</td>
<td>null</td>
<td>null</td>
</tr>
</tbody>
</table>
8.13.3. The **IN** operator and **null**

The **IN** operator follows similar logic. If Cypher knows that something exists in a list, the result will be **true**. Any list that contains a **null** and doesn’t have a matching element will return **null**. Otherwise, the result will be **false**. Here is a table with examples:

<table>
<thead>
<tr>
<th>Expression</th>
<th>Result</th>
</tr>
</thead>
<tbody>
<tr>
<td>2 IN [1, 2, 3]</td>
<td>true</td>
</tr>
<tr>
<td>2 IN [1, null, 3]</td>
<td>null</td>
</tr>
<tr>
<td>2 IN [1, 2, null]</td>
<td>true</td>
</tr>
<tr>
<td>2 IN [1]</td>
<td>false</td>
</tr>
<tr>
<td>2 IN []</td>
<td>false</td>
</tr>
<tr>
<td>null IN [1, 2, 3]</td>
<td>null</td>
</tr>
<tr>
<td>null IN [1, null, 3]</td>
<td>null</td>
</tr>
<tr>
<td>null IN []</td>
<td>false</td>
</tr>
</tbody>
</table>

Using **all**, **any**, **none**, and **single** follows a similar rule. If the result can be calculated definitely, **true** or **false** is returned. Otherwise **null** is produced.

8.13.4. The **[]** operator and **null**

Accessing a list or a map with **null** will result in **null**:

<table>
<thead>
<tr>
<th>Expression</th>
<th>Result</th>
</tr>
</thead>
<tbody>
<tr>
<td>[1, 2, 3][null]</td>
<td>null</td>
</tr>
<tr>
<td>[1, 2, 3, 4][null..2]</td>
<td>null</td>
</tr>
<tr>
<td>[1, 2, 3][1..null]</td>
<td>null</td>
</tr>
<tr>
<td>{age: 25}[null]</td>
<td>null</td>
</tr>
</tbody>
</table>

Using parameters to pass in the bounds, such as **a[$lower..$upper]**, may result in a **null** for the lower or upper bound (or both). The following workaround will prevent this from happening by setting the absolute minimum and maximum bound values:

```
a[coalesce($lower, 0)..coalesce($upper, size(a))]```

8.13.5. Expressions that return **null**

- Getting a missing element from a list: **[][0], head([])**
- Trying to access a property that does not exist on a node or relationship: **n.missingProperty**
- Comparisons when either side is **null**: **1 < null**
- Arithmetic expressions containing **null**: **1 + null**
• Function calls where any arguments are null: sin(null)

[2] This is in accordance with the Gregorian calendar; i.e. years AD/CE start at year 1, and the year before that (year 1 BC/BCE) is 0, while year 2 BCE is -1 etc.

[3] The first week of any year is the week that contains the first Thursday of the year, and thus always contains January 4.

[4] For dates from December 29, this could be the next year, and for dates until January 3 this could be the previous year, depending on how week 1 begins.

[5] Cypher does not support leap seconds; UTC-SLS (UTC with Smoothed Leap Seconds) is used to manage the difference in time between UTC and TAI (International Atomic Time).

[7] For the nanosecond part of the epoch offset, the regular nanosecond component (instant.nanosecond) can be used.
Chapter 9. Clauses

This section contains information on all the clauses in the Cypher query language.

- Reading clauses
- Projecting clauses
- Reading sub-clauses
- Reading hints
- Writing clauses
- Reading/Writing clauses
- Set operations
- Subquery clauses
- Multiple graphs
- Importing data
- Listing functions and procedures
- Administration clauses

Reading clauses

These comprise clauses that read data from the database.

The flow of data within a Cypher query is an unordered sequence of maps with key-value pairs — a set of possible bindings between the variables in the query and values derived from the database. This set is refined and augmented by subsequent parts of the query.

<table>
<thead>
<tr>
<th>Clause</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>MATCH</td>
<td>Specify the patterns to search for in the database.</td>
</tr>
<tr>
<td>OPTIONAL MATCH</td>
<td>Specify the patterns to search for in the database while using nulls for the</td>
</tr>
<tr>
<td></td>
<td>missing parts of the pattern.</td>
</tr>
</tbody>
</table>

Projecting clauses

These comprise clauses that define which expressions to return in the result set. The returned expressions may all be aliased using AS.

<table>
<thead>
<tr>
<th>Clause</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>RETURN ... [AS]</td>
<td>Defines what to include in the query result set.</td>
</tr>
<tr>
<td>WITH ... [AS]</td>
<td>Allows query parts to be chained together, piping the results from one to be</td>
</tr>
<tr>
<td></td>
<td>used as starting points or criteria in the next.</td>
</tr>
<tr>
<td>UNWIND ... [AS]</td>
<td>Expands a list into a sequence of rows.</td>
</tr>
</tbody>
</table>
Reading sub-clauses

These comprise sub-clauses that must operate as part of reading clauses.

<table>
<thead>
<tr>
<th>Sub-clause</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>WHERE</strong></td>
<td>Adds constraints to the patterns in a MATCH or OPTIONAL MATCH clause or filters the results of a WITH clause.</td>
</tr>
<tr>
<td><strong>WHERE EXISTS ( ... )</strong></td>
<td>An existential sub-query used to filter the results of a MATCH, OPTIONAL MATCH or WITH clause.</td>
</tr>
<tr>
<td>**ORDER BY [ASC[ENDING]</td>
<td>DESC[ENDING]]**</td>
</tr>
<tr>
<td><strong>SKIP</strong></td>
<td>Defines from which row to start including the rows in the output.</td>
</tr>
<tr>
<td><strong>LIMIT</strong></td>
<td>Constrains the number of rows in the output.</td>
</tr>
</tbody>
</table>

Reading hints

These comprise clauses used to specify planner hints when tuning a query. More details regarding the usage of these — and query tuning in general — can be found in Planner hints and the USING keyword.

<table>
<thead>
<tr>
<th>Hint</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>USING INDEX</strong></td>
<td>Index hints are used to specify which index, if any, the planner should use as a starting point.</td>
</tr>
<tr>
<td><strong>USING INDEX SEEK</strong></td>
<td>Index seek hint instructs the planner to use an index seek for this clause.</td>
</tr>
<tr>
<td><strong>USING SCAN</strong></td>
<td>Scan hints are used to force the planner to do a label scan (followed by a filtering operation) instead of using an index.</td>
</tr>
<tr>
<td><strong>USING JOIN</strong></td>
<td>Join hints are used to enforce a join operation at specified points.</td>
</tr>
</tbody>
</table>

Writing clauses

These comprise clauses that write the data to the database.

<table>
<thead>
<tr>
<th>Clause</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>CREATE</strong></td>
<td>Create nodes and relationships.</td>
</tr>
<tr>
<td><strong>DELETE</strong></td>
<td>Delete nodes, relationships or paths. Any node to be deleted must also have all associated relationships explicitly deleted.</td>
</tr>
<tr>
<td><strong>DETACH DELETE</strong></td>
<td>Delete a node or set of nodes. All associated relationships will automatically be deleted.</td>
</tr>
<tr>
<td>Clause</td>
<td>Description</td>
</tr>
<tr>
<td>---------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>SET</td>
<td>Update labels on nodes and properties on nodes and relationships.</td>
</tr>
<tr>
<td>REMOVE</td>
<td>Remove properties and labels from nodes and relationships.</td>
</tr>
<tr>
<td>FOREACH</td>
<td>Update data within a list, whether components of a path, or the result of aggregation.</td>
</tr>
</tbody>
</table>

### Reading/Writing clauses

These comprise clauses that both read data from and write data to the database.

<table>
<thead>
<tr>
<th>Clause</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>MERGE</td>
<td>Ensures that a pattern exists in the graph. Either the pattern already exists, or it needs to be created.</td>
</tr>
<tr>
<td>--- ON CREATE</td>
<td>Used in conjunction with MERGE, this write sub-clause specifies the actions to take if the pattern needs to be created.</td>
</tr>
<tr>
<td>--- ON MATCH</td>
<td>Used in conjunction with MERGE, this write sub-clause specifies the actions to take if the pattern already exists.</td>
</tr>
<tr>
<td>CALL ... [YIELD ... ]</td>
<td>Invokes a procedure deployed in the database and return any results.</td>
</tr>
</tbody>
</table>

### Set operations

<table>
<thead>
<tr>
<th>Clause</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>UNION</td>
<td>Combines the result of multiple queries into a single result set. Duplicates are removed.</td>
</tr>
<tr>
<td>UNION ALL</td>
<td>Combines the result of multiple queries into a single result set. Duplicates are retained.</td>
</tr>
</tbody>
</table>

### Subquery clauses

<table>
<thead>
<tr>
<th>Clause</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CALL { ... }</td>
<td>Evaluates a subquery, typically used for post-union processing or aggregations.</td>
</tr>
</tbody>
</table>

### Multiple graphs

<table>
<thead>
<tr>
<th>Clause</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>USE</td>
<td>Determines which graph a query, or query part, is executed against.</td>
</tr>
</tbody>
</table>

### Importing data
<table>
<thead>
<tr>
<th>Clause</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>LOAD CSV</td>
<td>Use when importing data from CSV files.</td>
</tr>
<tr>
<td>-- -- USING PERIODIC COMMIT</td>
<td>This query hint may be used to prevent an out-of-memory error from occurring when importing large amounts of data using LOAD CSV.</td>
</tr>
</tbody>
</table>

**Listing functions and procedures**

<table>
<thead>
<tr>
<th>Clause</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>SHOW FUNCTIONS</td>
<td>Lists the available functions.</td>
</tr>
<tr>
<td>SHOW PROCEDURES</td>
<td>Lists the available procedures.</td>
</tr>
</tbody>
</table>

**Administration clauses**

These comprise clauses used to manage databases, schema and security; further details can be found in Database management and Access control.

<table>
<thead>
<tr>
<th>Clause</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CREATE</td>
<td>DROP</td>
</tr>
<tr>
<td>CREATE</td>
<td>DROP INDEX</td>
</tr>
<tr>
<td>CREATE</td>
<td>DROP CONSTRAINT</td>
</tr>
<tr>
<td>Access control</td>
<td></td>
</tr>
</tbody>
</table>

**9.1. MATCH**

The **MATCH** clause is used to search for the pattern described in it.

- **Introduction**
- **Basic node finding**
  - Get all nodes
  - Get all nodes with a label
  - Related nodes
  - Match with labels
- **Relationship basics**
  - Outgoing relationships
  - Directed relationships and variable
  - Match on relationship type
9.1.1. Introduction

The MATCH clause allows you to specify the patterns Neo4j will search for in the database. This is the primary way of getting data into the current set of bindings. It is worth reading up more on the specification of the patterns themselves in Patterns.

MATCH is often coupled to a WHERE part which adds restrictions, or predicates, to the MATCH patterns, making them more specific. The predicates are part of the pattern description, and should not be considered a filter applied only after the matching is done. This means that WHERE should always be put together with the MATCH clause it belongs to.

MATCH can occur at the beginning of the query or later, possibly after a WITH. If it is the first clause, nothing will have been bound yet, and Neo4j will design a search to find the results matching the clause and any associated predicates specified in any WHERE part. This could involve a scan of the database, a search for nodes having a certain label, or a search of an index to find starting points for the pattern matching. Nodes and relationships found by this search are available as bound pattern elements, and can be used for pattern matching of paths. They can also be used in any further MATCH clauses, where Neo4j will use the known elements, and from there find further unknown elements.

Cypher is declarative, and so usually the query itself does not specify the algorithm to use to perform the
search. Neo4j will automatically work out the best approach to finding start nodes and matching patterns. Predicates in \textit{WHERE} parts can be evaluated before pattern matching, during pattern matching, or after finding matches. However, there are cases where you can influence the decisions taken by the query compiler. Read more about indexes in \textit{Indexes for search performance}, and more about specifying hints to force Neo4j to solve a query in a specific way in \textit{Planner hints and the USING keyword}.

To understand more about the patterns used in the \textit{MATCH} clause, read \textit{Patterns}.

The following graph is used for the examples below:

![Graph](image)

### 9.1.2. Basic node finding

#### Get all nodes

By just specifying a pattern with a single node and no labels, all nodes in the graph will be returned.

**Query**

```cypher
MATCH (n)
RETURN n
```

Returns all the nodes in the database.

**Table 90. Result**

<table>
<thead>
<tr>
<th>n</th>
</tr>
</thead>
<tbody>
<tr>
<td>Node[0]{name:&quot;Charlie Sheen&quot;}</td>
</tr>
<tr>
<td>Node[1]{name:&quot;Martin Sheen&quot;}</td>
</tr>
<tr>
<td>Node[2]{name:&quot;Michael Douglas&quot;}</td>
</tr>
<tr>
<td>Node[3]{name:&quot;Oliver Stone&quot;}</td>
</tr>
<tr>
<td>Node[4]{name:&quot;Rob Reiner&quot;}</td>
</tr>
<tr>
<td>Node[5]{title:&quot;Wall Street&quot;}</td>
</tr>
<tr>
<td>Node[6]{title:&quot;The American President&quot;}</td>
</tr>
</tbody>
</table>

Rows: 7

#### Get all nodes with a label

Getting all nodes with a label on them is done with a single node pattern where the node has a label on it.

**Query**

```cypher
MATCH (movie:Movie)
RETURN movie.title
```
Returns all the movies in the database.

Table 91. Result

<table>
<thead>
<tr>
<th>movie.title</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;Wall Street&quot;</td>
</tr>
<tr>
<td>&quot;The American President&quot;</td>
</tr>
</tbody>
</table>

Rows: 2

Related nodes

The symbol -- means related to, without regard to type or direction of the relationship.

Query

```cql
MATCH (director {name: 'Oliver Stone'})--(movie)
RETURN movie.title
```

Returns all the movies directed by 'Oliver Stone'.

Table 92. Result

<table>
<thead>
<tr>
<th>movie.title</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;Wall Street&quot;</td>
</tr>
</tbody>
</table>

Rows: 1

Match with labels

To constrain your pattern with labels on nodes, you add it to your pattern nodes, using the label syntax.

Query

```cql
MATCH (:Person {name: 'Oliver Stone'})--(movie:Movie)
RETURN movie.title
```

Returns any nodes connected with the Person 'Oliver' that are labeled Movie.

Table 93. Result

<table>
<thead>
<tr>
<th>movie.title</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;Wall Street&quot;</td>
</tr>
</tbody>
</table>

Rows: 1

9.1.3. Relationship basics

Outgoing relationships

When the direction of a relationship is of interest, it is shown by using --> or <--, like this:
Returns any nodes connected with the Person 'Oliver' by an outgoing relationship.

**Table 94. Result**

<table>
<thead>
<tr>
<th>movie.title</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;Wall Street&quot;</td>
</tr>
</tbody>
</table>

Rows: 1

Directed relationships and variable

If a variable is required, either for filtering on properties of the relationship, or to return the relationship, this is how you introduce the variable.

**Query**

```
MATCH (:Person {name: 'Oliver Stone'})-[r]->(movie)
RETURN type(r)
```

Returns the type of each outgoing relationship from 'Oliver'.

**Table 95. Result**

<table>
<thead>
<tr>
<th>type(r)</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;DIRECTED&quot;</td>
</tr>
</tbody>
</table>

Rows: 1

Match on relationship type

When you know the relationship type you want to match on, you can specify it by using a colon together with the relationship type.

**Query**

```
MATCH (wallstreet:Movie {title: 'Wall Street'})-[:ACTED_IN]->(actor)
RETURN actor.name
```

Returns all actors that ACTED_IN 'Wall Street'.

**Table 96. Result**

<table>
<thead>
<tr>
<th>actor.name</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;Michael Douglas&quot;</td>
</tr>
<tr>
<td>&quot;Martin Sheen&quot;</td>
</tr>
<tr>
<td>&quot;Charlie Sheen&quot;</td>
</tr>
</tbody>
</table>
Match on multiple relationship types

To match on one of multiple types, you can specify this by chaining them together with the pipe symbol |.

Query

```
MATCH (wallstreet {title: 'Wall Street'})<-[:ACTED_IN|DIRECTED]-(person)
RETURN person.name
```

Returns nodes with an ACTED_IN or DIRECTED relationship to 'Wall Street'.

Table 97. Result

<table>
<thead>
<tr>
<th>person.name</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;Oliver Stone&quot;</td>
</tr>
<tr>
<td>&quot;Michael Douglas&quot;</td>
</tr>
<tr>
<td>&quot;Martin Sheen&quot;</td>
</tr>
<tr>
<td>&quot;Charlie Sheen&quot;</td>
</tr>
</tbody>
</table>

Rows: 4

Match on relationship type and use a variable

If you both want to introduce an variable to hold the relationship, and specify the relationship type you want, just add them both, like this:

Query

```
MATCH (wallstreet {title: 'Wall Street'})<-[r:ACTED_IN]-(actor)
RETURN r.role
```

Returns ACTED_IN roles for 'Wall Street'.

Table 98. Result

<table>
<thead>
<tr>
<th>r.role</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;Gordon Gekko&quot;</td>
</tr>
<tr>
<td>&quot;Carl Fox&quot;</td>
</tr>
<tr>
<td>&quot;Bud Fox&quot;</td>
</tr>
</tbody>
</table>

Rows: 3

9.1.4. Relationships in depth
Inside a single pattern, relationships will only be matched once. You can read more about this in Cypher path matching.

Relationship types with uncommon characters

Sometimes your database will have types with non-letter characters, or with spaces in them. Use ` (backtick) to quote these. To demonstrate this we can add an additional relationship between 'Charlie Sheen' and 'Rob Reiner':

Query

```
MATCH
(charlie:Person {name: 'Charlie Sheen'}),
(rob:Person {name: 'Rob Reiner'})
CREATE (rob)-[:"TYPE INCLUDING A SPACE"]->(charlie)
```

Which leads to the following graph:

Graph

Query

```
MATCH (n {name: 'Rob Reiner'})-[r:"TYPE INCLUDING A SPACE"]->()
RETURN type(r)
```

Returns a relationship type with spaces in it.

Table 99. Result

<table>
<thead>
<tr>
<th>type(r)</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;TYPE INCLUDING A SPACE&quot;</td>
</tr>
</tbody>
</table>

Multiple relationships

Relationships can be expressed by using multiple statements in the form of ()--(), or they can be strung together, like this:

Query

```
MATCH (charlie {name: 'Charlie Sheen'})-[:ACTED_IN]-(movie)<-[:DIRECTED]-(director)
RETURN movie.title, director.name
```

Returns the movie 'Charlie Sheen' acted in and its director.

Table 100. Result
Variable length relationships

Nodes that are a variable number of relationship->node hops away can be found using the following syntax: -[:TYPE*minHops..maxHops]->. minHops and maxHops are optional and default to 1 and infinity respectively. When no bounds are given the dots may be omitted. The dots may also be omitted when setting only one bound and this implies a fixed length pattern.

Query

```cypher
MATCH (charlie {name: 'Charlie Sheen'})-[:ACTED_IN*1..3]-(movie:Movie)
RETURN movie.title
```

Returns all movies related to 'Charlie Sheen' by 1 to 3 hops.

Table 101. Result

<table>
<thead>
<tr>
<th>movie.title</th>
<th>director.name</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;Wall Street&quot;</td>
<td>&quot;Oliver Stone&quot;</td>
</tr>
</tbody>
</table>

Rows: 1

Variable length relationships with multiple relationship types

Variable length relationships can be combined with multiple relationship types. In this case the *minHops..maxHops applies to all relationship types as well as any combination of them.

Query

```cypher
MATCH (charlie {name: 'Charlie Sheen'})-[:ACTED_IN|DIRECTED*2]-(person:Person)
RETURN person.name
```

Returns all people related to 'Charlie Sheen' by 2 hops with any combination of the relationship types ACTED_IN and DIRECTED.

Table 102. Result

<table>
<thead>
<tr>
<th>person.name</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;Oliver Stone&quot;</td>
</tr>
<tr>
<td>&quot;Michael Douglas&quot;</td>
</tr>
<tr>
<td>&quot;Martin Sheen&quot;</td>
</tr>
</tbody>
</table>

Rows: 3
Relationship variable in variable length relationships

When the connection between two nodes is of variable length, the list of relationships comprising the connection can be returned using the following syntax:

Query

```plaintext
MATCH p = (actor {name: 'Charlie Sheen'})-[[:ACTED_IN*2]]-(co_actor)
RETURN relationships(p)
```

Returns a list of relationships.

Table 103. Result

<table>
<thead>
<tr>
<th>relationships(p)</th>
</tr>
</thead>
<tbody>
<tr>
<td>[:ACTED_IN[0]{role:&quot;Bud Fox&quot;},:ACTED_IN[2]{role:&quot;Gordon Gekko&quot;}]</td>
</tr>
<tr>
<td>[:ACTED_IN[0]{role:&quot;Bud Fox&quot;},:ACTED_IN[1]{role:&quot;Carl Fox&quot;}]</td>
</tr>
</tbody>
</table>

Rows: 2

Match with properties on a variable length path

A variable length relationship with properties defined on it means that all relationships in the path must have the property set to the given value. In this query, there are two paths between 'Charlie Sheen' and his father 'Martin Sheen'. One of them includes a 'blocked' relationship and the other does not. In this case we first alter the original graph by using the following query to add BLOCKED and UNBLOCKED relationships:

Query

```plaintext
MATCH (charlie:Person {name: 'Charlie Sheen'}),
(martin:Person {name: 'Martin Sheen'})
CREATE (charlie)-[:X {blocked: false}]>(:UNBLOCKED)<-[:X {blocked: false}]-(martin)
CREATE (charlie)-[:X {blocked: true}]>(:BLOCKED)<-[:X {blocked: false}]-(martin)
```

This means that we are starting out with the following graph:

![Graph](image)

Table 104. Result

Returns the paths between 'Charlie Sheen' and 'Martin Sheen' where all relationships have the blocked property set to false.
Zero length paths

Using variable length paths that have the lower bound zero means that two variables can point to the same node. If the path length between two nodes is zero, they are by definition the same node. Note that when matching zero length paths the result may contain a match even when matching on a relationship type not in use.

Query

```
MATCH (wallstreet:Movie {title: 'Wall Street'})-[*0..1]-(x)
RETURN x
```

Returns the movie itself as well as actors and directors one relationship away

Table 105. Result

<table>
<thead>
<tr>
<th>x</th>
</tr>
</thead>
<tbody>
<tr>
<td>Node[5]{title:&quot;Wall Street&quot;}</td>
</tr>
<tr>
<td>Node[3]{name:&quot;Oliver Stone&quot;}</td>
</tr>
<tr>
<td>Node[2]{name:&quot;Michael Douglas&quot;}</td>
</tr>
<tr>
<td>Node[1]{name:&quot;Martin Sheen&quot;}</td>
</tr>
<tr>
<td>Node[0]{name:&quot;Charlie Sheen&quot;}</td>
</tr>
</tbody>
</table>

Rows: 5

Named paths

If you want to return or filter on a path in your pattern graph, you can introduce a named path.

Query

```
MATCH p = (michael {name: 'Michael Douglas'})-->()
RETURN p
```

Returns the two paths starting from 'Michael Douglas'

Table 106. Result

<table>
<thead>
<tr>
<th>p</th>
</tr>
</thead>
<tbody>
<tr>
<td>(2)-[ACTED_IN,2]-&gt;(5)</td>
</tr>
<tr>
<td>(2)-[ACTED_IN,5]-&gt;(6)</td>
</tr>
</tbody>
</table>

Rows: 2
Matching on a bound relationship

When your pattern contains a bound relationship, and that relationship pattern does not specify direction, Cypher will try to match the relationship in both directions.

```
MATCH (a)-[r]-(b)
WHERE id(r) = 0
RETURN a, b
```

This returns the two connected nodes, once as the start node, and once as the end node

<table>
<thead>
<tr>
<th>a</th>
<th>b</th>
</tr>
</thead>
</table>

Rows: 2

9.1.5. Shortest path

Single shortest path

Finding a single shortest path between two nodes is as easy as using the `shortestPath` function. It is done like this:

```
MATCH
  (martin:Person {name: 'Martin Sheen'}),
  (oliver:Person {name: 'Oliver Stone'}),
  p = shortestPath((martin)-[*..15]-(oliver))
RETURN p
```

This means: find a single shortest path between two nodes, as long as the path is max 15 relationships long. Within the parentheses you define a single link of a path — the starting node, the connecting relationship and the end node. Characteristics describing the relationship like relationship type, max hops and direction are all used when finding the shortest path. If there is a `WHERE` clause following the match of a `shortestPath`, relevant predicates will be included in the `shortestPath`. If the predicate is a `none()` or `all()` on the relationship elements of the path, it will be used during the search to improve performance (see Shortest path planning).

<table>
<thead>
<tr>
<th>p</th>
</tr>
</thead>
<tbody>
<tr>
<td>(1)-[ACTED_IN,1] -&gt;(5)&lt;-[DIRECTED,3]-(3)</td>
</tr>
</tbody>
</table>

Rows: 1
Single shortest path with predicates

Predicates used in the WHERE clause that apply to the shortest path pattern are evaluated before deciding what the shortest matching path is.

Query

```
MATCH
  (charlie:Person {name: 'Charlie Sheen'}),
  (martin:Person {name: 'Martin Sheen'}),
  p = shortestPath((charlie)-[*]-(martin))
WHERE none(r IN relationships(p) WHERE type(r) = 'FATHER')
RETURN p
```

This query will find the shortest path between 'Charlie Sheen' and 'Martin Sheen', and the WHERE predicate will ensure that we do not consider the father/son relationship between the two.

Table 109. Result

<table>
<thead>
<tr>
<th>p</th>
</tr>
</thead>
<tbody>
<tr>
<td>(0)-[ACTED_IN,0]-&gt;(5)&lt;-[ACTED_IN,1]-(1)</td>
</tr>
</tbody>
</table>

Rows: 1

All shortest paths

Finds all the shortest paths between two nodes.

Query

```
MATCH
  (martin:Person {name: 'Martin Sheen'}),
  (michael:Person {name: 'Michael Douglas'}),
  p = allShortestPaths((martin)-[*]-(michael))
RETURN p
```

Finds the two shortest paths between 'Martin Sheen' and 'Michael Douglas'.

Table 110. Result

<table>
<thead>
<tr>
<th>p</th>
</tr>
</thead>
<tbody>
<tr>
<td>(1)-[ACTED_IN,1]-&gt;(5)&lt;-[ACTED_IN,2]-(2)</td>
</tr>
<tr>
<td>(1)-[ACTED_IN,4]-&gt;(6)&lt;-[ACTED_IN,5]-(2)</td>
</tr>
</tbody>
</table>

Rows: 2

9.1.6. Get node or relationship by id

Node by id

Searching for nodes by id can be done with the id() function in a predicate.
Neo4j reuses its internal ids when nodes and relationships are deleted. This means that applications using, and relying on internal Neo4j ids, are brittle or at risk of making mistakes. It is therefore recommended to rather use application-generated ids.

Query

```
MATCH (n)
WHERE id(n) = 0
RETURN n
```

The corresponding node is returned.

Table 111. Result

<table>
<thead>
<tr>
<th>n</th>
</tr>
</thead>
<tbody>
<tr>
<td>Node[0]{name:&quot;Charlie Sheen&quot;}</td>
</tr>
<tr>
<td>Rows: 1</td>
</tr>
</tbody>
</table>

Relationship by id

Search for relationships by id can be done with the `id()` function in a predicate.

This is not the recommended practice. See Node by id for more information on the use of Neo4j ids.

Query

```
MATCH ()-[r]->()
WHERE id(r) = 0
RETURN r
```

The relationship with id 0 is returned.

Table 112. Result

<table>
<thead>
<tr>
<th>r</th>
</tr>
</thead>
<tbody>
<tr>
<td>:ACTED_IN[0]{role:&quot;Bud Fox&quot;}</td>
</tr>
<tr>
<td>Rows: 1</td>
</tr>
</tbody>
</table>

Multiple nodes by id

Multiple nodes are selected by specifying them in an IN clause.

Query

```
MATCH (n)
WHERE id(n) IN [0, 3, 5]
RETURN n
```

This returns the nodes listed in the IN expression.

Table 113. Result
9.2. OPTIONAL MATCH

The **OPTIONAL MATCH** clause is used to search for the pattern described in it, while using nulls for missing parts of the pattern.

- Introduction
- Optional relationships
- Properties on optional elements
- Optional typed and named relationship

### 9.2.1. Introduction

**OPTIONAL MATCH** matches patterns against your graph database, just like MATCH does. The difference is that if no matches are found, **OPTIONAL MATCH** will use a null for missing parts of the pattern. **OPTIONAL MATCH** could be considered the Cypher equivalent of the outer join in SQL.

Either the whole pattern is matched, or nothing is matched. Remember that **WHERE** is part of the pattern description, and the predicates will be considered while looking for matches, not after. This matters especially in the case of multiple (**OPTIONAL**) MATCH clauses, where it is crucial to put **WHERE** together with the **MATCH** it belongs to.

To understand the patterns used in the **OPTIONAL MATCH** clause, read [Patterns](#).

The following graph is used for the examples below:

![Graph](#)

### 9.2.2. Optional relationships

If a relationship is optional, use the **OPTIONAL MATCH** clause. This is similar to how a SQL outer join works. If the relationship is there, it is returned. If it’s not, null is returned in its place.
9.2.3. Properties on optional elements

Returning a property from an optional element that is `null` will also return `null`.

Query

```
MATCH (a:Movie {title: 'Wall Street'})
OPTIONAL MATCH (a)-->(x)
RETURN x, x.name
```

Returns the element `x` (`null` in this query), and `null` as its name.

Table 115. Result

<table>
<thead>
<tr>
<th>x</th>
<th>x.name</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;null&gt;</td>
<td>&lt;null&gt;</td>
</tr>
</tbody>
</table>

Rows: 1

9.2.4. Optional typed and named relationship

Just as with a normal relationship, you can decide which variable it goes into, and what relationship type you need.

Query

```
MATCH (a:Movie {title: 'Wall Street'})
OPTIONAL MATCH (a)-[r:ACTS_IN]-(x)
RETURN a.title, r
```

This returns the title of the node, 'Wall Street', and, since the node has no outgoing `ACTS_IN` relationships, `null` is returned for the relationship denoted by `r`.

Table 116. Result

<table>
<thead>
<tr>
<th>a.title</th>
<th>r</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;Wall Street&quot;</td>
<td>&lt;null&gt;</td>
</tr>
</tbody>
</table>
9.3. RETURN

The RETURN clause defines what to include in the query result set.

- Introduction
- Return nodes
- Return relationships
- Return property
- Return all elements
- Variable with uncommon characters
- Column alias
- Optional properties
- Other expressions
- Unique results

9.3.1. Introduction

In the RETURN part of your query, you define which parts of the pattern you are interested in. It can be nodes, relationships, or properties on these.

If what you actually want is the value of a property, make sure to not return the full node/relationship. This will improve performance.

Graph

9.3.2. Return nodes

To return a node, list it in the RETURN statement.

Query

MATCH (n {name: 'B'})
RETURN n
The example will return the node.

Table 117. Result

<table>
<thead>
<tr>
<th>n</th>
</tr>
</thead>
<tbody>
<tr>
<td>Node[1]{name:&quot;B&quot;}</td>
</tr>
<tr>
<td>Rows: 1</td>
</tr>
</tbody>
</table>

9.3.3. Return relationships

To return a relationship, just include it in the RETURN list.

Query

```
MATCH (n { name: 'A' })-[r:KNOWS]->(c)
RETURN r
```

The relationship is returned by the example.

Table 118. Result

<table>
<thead>
<tr>
<th>r</th>
</tr>
</thead>
<tbody>
<tr>
<td>:KNOWS[0]{}</td>
</tr>
<tr>
<td>Rows: 1</td>
</tr>
</tbody>
</table>

9.3.4. Return property

To return a property, use the dot separator, like this:

Query

```
MATCH (n { name: 'A' })
RETURN n.name
```

The value of the property name gets returned.

Table 119. Result

<table>
<thead>
<tr>
<th>n.name</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;A&quot;</td>
</tr>
<tr>
<td>Rows: 1</td>
</tr>
</tbody>
</table>

9.3.5. Return all elements

When you want to return all nodes, relationships and paths found in a query, you can use the * symbol.
9.3.6. Variable with uncommon characters

To introduce a placeholder that is made up of characters that are not contained in the English alphabet, you can use the ` ` to enclose the variable, like this:

Query

```
MATCH (`This isn't a common variable`)  
WHERE `This isn't a common variable`.name = 'A'  
RETURN `This isn't a common variable`.happy
```

The node with name "A" is returned.

Table 121. Result

<table>
<thead>
<tr>
<th><code>This isn't a common variable</code>.happy</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;Yes!&quot;</td>
</tr>
</tbody>
</table>

Rows: 1

9.3.7. Column alias

If the name of the column should be different from the expression used, you can rename it by using AS <new name>.

Query

```
MATCH (a { name: 'A'})  
RETURN a.age AS SomethingTotallyDifferent
```

Returns the age property of a node, but renames the column.

Table 122. Result

<table>
<thead>
<tr>
<th>SomethingTotallyDifferent</th>
</tr>
</thead>
<tbody>
<tr>
<td>55</td>
</tr>
</tbody>
</table>
9.3.8. Optional properties

If a property might or might not be there, you can still select it as usual. It will be treated as null if it is missing.

Query

```
MATCH (n)
RETURN n.age
```

This example returns the age when the node has that property, or null if the property is not there.

Table 123. Result

<table>
<thead>
<tr>
<th>n.age</th>
</tr>
</thead>
<tbody>
<tr>
<td>55</td>
</tr>
<tr>
<td>&lt;null&gt;</td>
</tr>
</tbody>
</table>

Rows: 2

9.3.9. Other expressions

Any expression can be used as a return item — literals, predicates, properties, functions, and everything else.

Query

```
MATCH (a {name: 'A'})
RETURN a.age > 30, "I'm a literal", (a)--()
```

Returns a predicate, a literal and function call with a pattern expression parameter.

Table 124. Result

<table>
<thead>
<tr>
<th>a.age &gt; 30</th>
<th>&quot;I'm a literal&quot;</th>
<th>(a)--()</th>
</tr>
</thead>
<tbody>
<tr>
<td>true</td>
<td>&quot;I'm a literal&quot;</td>
<td>[[(0)-[BLOCKS,1]-&gt;(1),(0)-[KNOWS,0]-&gt;(1)]]</td>
</tr>
</tbody>
</table>

Rows: 1

9.3.10. Unique results

DISTINCT retrieves only unique rows depending on the columns that have been selected to output.

Query

```
MATCH (a {name: 'A'})-->(b)
RETURN DISTINCT b
```
The node named "B" is returned by the query, but only once.

Table 125. Result

<table>
<thead>
<tr>
<th>b</th>
</tr>
</thead>
<tbody>
<tr>
<td>Node<a href="" title="B">1</a></td>
</tr>
<tr>
<td>Rows: 1</td>
</tr>
</tbody>
</table>

9.4. WITH

The **WITH** clause allows query parts to be chained together, piping the results from one to be used as starting points or criteria in the next.

It is important to note that **WITH** affects variables in scope. Any variables not included in the **WITH** clause are not carried over to the rest of the query.

- Introduction
- Filter on aggregate function results
- Sort results before using collect on them
- Limit branching of a path search

9.4.1. Introduction

Using **WITH**, you can manipulate the output before it is passed on to the following query parts. The manipulations can be of the shape and/or number of entries in the result set.

One common usage of **WITH** is to limit the number of entries that are then passed on to other **MATCH** clauses. By combining **ORDER BY** and **LIMIT**, it’s possible to get the top X entries by some criteria, and then bring in additional data from the graph.

Another use is to filter on aggregated values. **WITH** is used to introduce aggregates which can then be used in predicates in **WHERE**. These aggregate expressions create new bindings in the results. **WITH** can also, like **RETURN**, alias expressions that are introduced into the results using the aliases as the binding name.

**WITH** is also used to separate reading from updating of the graph. Every part of a query must be either read-only or write-only. When going from a writing part to a reading part, the switch must be done with a **WITH** clause.
9.4.2. Filter on aggregate function results

Aggregated results have to pass through a `WITH` clause to be able to filter on.

**Query**

```
MATCH (david {name: 'David'})-<>{(otherPerson)-->()
WITH otherPerson, count(*) AS foaf
WHERE foaf > 1
RETURN otherPerson.name
```

The name of the person connected to 'David' with the at least more than one outgoing relationship will be returned by the query.

**Table 126. Result**

<table>
<thead>
<tr>
<th>otherPerson.name</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;Anders&quot;</td>
</tr>
</tbody>
</table>

Rows: 1

9.4.3. Sort results before using `collect` on them

You can sort your results before passing them to `collect`, thus sorting the resulting list.

**Query**

```
MATCH (n)
WITH n
ORDER BY n.name DESC
LIMIT 3
RETURN collect(n.name)
```

A list of the names of people in reverse order, limited to 3, is returned in a list.

**Table 127. Result**

<table>
<thead>
<tr>
<th>collect(n.name)</th>
</tr>
</thead>
<tbody>
<tr>
<td>[&quot;George&quot;,&quot;David&quot;,&quot;Caesar&quot;]</td>
</tr>
</tbody>
</table>
9.4.4. Limit branching of a path search

You can match paths, limit to a certain number, and then match again using those paths as a base, as well as any number of similar limited searches.

Query

```sql
MATCH (n {name: 'Anders'})--(m)
WITH m
ORDER BY m.name DESC
LIMIT 1
MATCH (m)--(o)
RETURN o.name
```

Starting at 'Anders', find all matching nodes, order by name descending and get the top result, then find all the nodes connected to that top result, and return their names.

Table 128. Result

<table>
<thead>
<tr>
<th>o.name</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;Anders&quot;</td>
</tr>
<tr>
<td>&quot;Bossman&quot;</td>
</tr>
</tbody>
</table>

Rows: 2

9.5. UNWIND

**UNWIND** expands a list into a sequence of rows.

- Introduction
- Unwinding a list
- Creating a distinct list
- Using **UNWIND** with any expression returning a list
- Using **UNWIND** with a list of lists
- Using **UNWIND** with an empty list
- Using **UNWIND** with an expression that is not a list
- Creating nodes from a list parameter

9.5.1. Introduction

With **UNWIND**, you can transform any list back into individual rows. These lists can be parameters that were passed in, previously **collect**-ed result or other list expressions.
One common usage of unwind is to create distinct lists. Another is to create data from parameter lists that are provided to the query.

**UNWIND** requires you to specify a new name for the inner values.

### 9.5.2. Unwinding a list

We want to transform the literal list into rows named \( x \) and return them.

**Query**

```
UNWIND [1, 2, 3, null] AS x
RETURN x, 'val' AS y
```

Each value of the original list — including null — is returned as an individual row.

**Table 129. Result**

<table>
<thead>
<tr>
<th>x</th>
<th>y</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>&quot;val&quot;</td>
</tr>
<tr>
<td>2</td>
<td>&quot;val&quot;</td>
</tr>
<tr>
<td>3</td>
<td>&quot;val&quot;</td>
</tr>
<tr>
<td>&lt;null&gt;</td>
<td>&quot;val&quot;</td>
</tr>
</tbody>
</table>

Rows: 4

### 9.5.3. Creating a distinct list

We want to transform a list of duplicates into a set using **DISTINCT**.

**Query**

```
WITH [1, 1, 2, 2] AS coll
UNWIND coll AS x
WITH DISTINCT x
RETURN collect(x) AS setOfVals
```

Each value of the original list is unwound and passed through **DISTINCT** to create a unique set.

**Table 130. Result**

<table>
<thead>
<tr>
<th>setOfVals</th>
</tr>
</thead>
<tbody>
<tr>
<td>[1, 2]</td>
</tr>
</tbody>
</table>

Rows: 1

### 9.5.4. Using UNWIND with any expression returning a list

Any expression that returns a list may be used with **UNWIND**.
### 9.5.5. Using `UNWIND` with a list of lists

Multiple `UNWIND` clauses can be chained to unwind nested list elements.

**Query**

```sql
WITH [[1, 2], [3, 4], 5] AS nested
UNWIND nested AS x
UNWIND x AS y
RETURN y
```

The first `UNWIND` results in three rows for `x`, each of which contains an element of the original list (two of which are also lists); namely, `[1, 2]`, `[3, 4]` and `5`. The second `UNWIND` then operates on each of these rows in turn, resulting in five rows for `y`.

**Table 132. Result**

<table>
<thead>
<tr>
<th>y</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
</tr>
<tr>
<td>2</td>
</tr>
<tr>
<td>3</td>
</tr>
<tr>
<td>4</td>
</tr>
<tr>
<td>5</td>
</tr>
<tr>
<td>Rows: 5</td>
</tr>
</tbody>
</table>

### 9.5.6. Using `UNWIND` with an empty list

Using an empty list with `UNWIND` will produce no rows, irrespective of whether or not any rows existed beforehand, or whether or not other values are being projected.
Essentially, **UNWIND []** reduces the number of rows to zero, and thus causes the query to cease its execution, returning no results. This has value in cases such as **UNWIND v**, where v is a variable from an earlier clause that may or may not be an empty list — when it is an empty list, this will behave just as a **MATCH** that has no results.

**Query**

```
UNWIND [] AS empty
RETURN empty, 'literal_that_is_not_returned'
```

**Table 133. Result**

<table>
<thead>
<tr>
<th>(empty result)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Rows: 0</td>
</tr>
</tbody>
</table>

To avoid inadvertently using **UNWIND** on an empty list, **CASE** may be used to replace an empty list with a null:

```
WITH [] AS list
UNWIND CASE
  WHEN list = [] THEN [null]
  ELSE list
END AS emptylist
RETURN emptylist
```

### 9.5.7. Using **UNWIND** with an expression that is not a list

Using **UNWIND** on an expression that does not return a list, will return the same result as using **UNWIND** on a list that just contains that expression. As an example, **UNWIND 5** is effectively equivalent to **UNWIND[5]**. The exception to this is when the expression returns **null** — this will reduce the number of rows to zero, causing it to cease its execution and return no results.

**Query**

```
UNWIND null AS x
RETURN x, 'some_literal'
```

**Table 134. Result**

<table>
<thead>
<tr>
<th>(empty result)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Rows: 0</td>
</tr>
</tbody>
</table>

### 9.5.8. Creating nodes from a list parameter

Create a number of nodes and relationships from a parameter-list without using **FOREACH**.
Parameters

```
{
  "events" : [ {
    "year" : 2014,
    "id" : 1
  }, {
    "year" : 2014,
    "id" : 2
  }
}
```

Query

```
UNWIND $events AS event
MERGE (y:Year {year: event.year})
MERGE (y)<-[i:IN]-(e:Event {id: event.id})
RETURN e.id AS x ORDER BY x
```

Each value of the original list is unwound and passed through MERGE to find or create the nodes and relationships.

Table 135. Result

<table>
<thead>
<tr>
<th>x</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
</tr>
<tr>
<td>2</td>
</tr>
</tbody>
</table>

Rows: 2
Nodes created: 3
Relationships created: 2
Properties set: 3
Labels added: 3

9.6. WHERE

WHERE adds constraints to the patterns in a MATCH or OPTIONAL MATCH clause or filters the results of a WITH clause.

- Introduction
- Basic usage
  - Boolean operations
  - Filter on node label
  - Filter on node property
  - Filter on relationship property
  - Filter on dynamically-computed property
  - Property existence checking
- String matching
  - Prefix string search using STARTS WITH
• Suffix string search using ENDS WITH
• Substring search using CONTAINS
• String matching negation

• Regular expressions
  • Matching using regular expressions
  • Escaping in regular expressions
  • Case-insensitive regular expressions

• Using path patterns in WHERE
  • Filter on patterns
  • Filter on patterns using NOT
  • Filter on patterns with properties
  • Filter on relationship type

• Using existential subqueries in WHERE
  • Simple existential subquery
  • Existential subquery with WHERE clause
  • Nesting existential subqueries

• Lists
  • IN operator

• Missing properties and values
  • Default to false if property is missing
  • Default to true if property is missing
  • Filter on null

• Using ranges
  • Simple range
  • Composite range

9.6.1. Introduction

WHERE is not a clause in its own right — rather, it’s part of MATCH, OPTIONAL MATCH and WITH.

In the case of WITH, WHERE simply filters the results.

For MATCH and OPTIONAL MATCH on the other hand, WHERE adds constraints to the patterns described. It should not be seen as a filter after the matching is finished.

| ! | In the case of multiple MATCH / OPTIONAL MATCH clauses, the predicate in WHERE is always a part of the patterns in the directly preceding MATCH / OPTIONAL MATCH. Both results and performance may be impacted if the WHERE is put inside the wrong MATCH clause. |
Indexes may be used to optimize queries using WHERE in a variety of cases.

The following graph is used for the examples below:

Graph

9.6.2. Basic usage

Boolean operations

You can use the boolean operators AND, OR, XOR and NOT. See Working with null for more information on how this works with null.

Query

```
MATCH (n:Person)
WHERE n.name = 'Peter' XOR (n.age < 30 AND n.name = 'Timothy') OR NOT (n.name = 'Timothy' OR n.name = 'Peter')
RETURN n.name, n.age
```

Table 136. Result

<table>
<thead>
<tr>
<th>n.name</th>
<th>n.age</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;Andy&quot;</td>
<td>36</td>
</tr>
<tr>
<td>&quot;Timothy&quot;</td>
<td>25</td>
</tr>
<tr>
<td>&quot;Peter&quot;</td>
<td>35</td>
</tr>
</tbody>
</table>

Rows: 3

Filter on node label

To filter nodes by label, write a label predicate after the WHERE keyword using WHERE n:foo.
Query

```
MATCH (n)
WHERE n:Swedish
RETURN n.name, n.age
```

The name and age for the 'Andy' node will be returned.

Table 137. Result

<table>
<thead>
<tr>
<th>n.name</th>
<th>n.age</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;Andy&quot;</td>
<td>36</td>
</tr>
</tbody>
</table>

Rows: 1

Filter on node property

To filter on a node property, write your clause after the `WHERE` keyword.

Query

```
MATCH (n:Person)
WHERE n.age < 30
RETURN n.name, n.age
```

The name and age values for the 'Timothy' node are returned because he is less than 30 years of age.

Table 138. Result

<table>
<thead>
<tr>
<th>n.name</th>
<th>n.age</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;Timothy&quot;</td>
<td>25</td>
</tr>
</tbody>
</table>

Rows: 1

Filter on relationship property

To filter on a relationship property, write your clause after the `WHERE` keyword.

Query

```
MATCH (n:Person)-[k:KNOWS]->(f)
WHERE k.since < 2000
RETURN f.name, f.age, f.email
```

The name, age and email values for the 'Peter' node are returned because Andy has known him since before 2000.

Table 139. Result

<table>
<thead>
<tr>
<th>f.name</th>
<th>f.age</th>
<th>f.email</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;Peter&quot;</td>
<td>35</td>
<td>&quot;<a href="mailto:peter_n@example.com">peter_n@example.com</a>&quot;</td>
</tr>
</tbody>
</table>

Rows: 1
Filter on dynamically-computed node property

To filter on a property using a dynamically computed name, use square bracket syntax.

Query

```csharp
WITH 'AGE' AS propname
MATCH (n:Person)
WHERE n[toLower(propname)] < 30
RETURN n.name, n.age
```

The name and age values for the 'Timothy' node are returned because he is less than 30 years of age.

Table 140. Result

<table>
<thead>
<tr>
<th>n.name</th>
<th>n.age</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;Timothy&quot;</td>
<td>25</td>
</tr>
</tbody>
</table>

Rows: 1

Property existence checking

Use the IS NOT NULL predicate to only include nodes or relationships in which a property exists.

Query

```csharp
MATCH (n:Person)
WHERE n.belt IS NOT NULL
RETURN n.name, n.belt
```

The name and belt for the 'Andy' node are returned because he is the only one with a belt property.

The exists() function has been deprecated for property existence checking and has been superseded by IS NOT NULL.

Table 141. Result

<table>
<thead>
<tr>
<th>n.name</th>
<th>n.belt</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;Andy&quot;</td>
<td>&quot;white&quot;</td>
</tr>
</tbody>
</table>

Rows: 1

9.6.3. String matching

The prefix and suffix of a string can be matched using STARTS WITH and ENDS WITH. To undertake a substring search - i.e. match regardless of location within a string - use CONTAINS. The matching is case-sensitive. Attempting to use these operators on values which are not strings will return null.

Prefix string search using STARTS WITH

The STARTS WITH operator is used to perform case-sensitive matching on the beginning of a string.
The name and age for the 'Peter' node are returned because his name starts with 'Pet'.

Table 142. Result

<table>
<thead>
<tr>
<th>n.name</th>
<th>n.age</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;Peter&quot;</td>
<td>35</td>
</tr>
</tbody>
</table>

Rows: 1

Suffix string search using **ENDS WITH**

The **ENDS WITH** operator is used to perform case-sensitive matching on the ending of a string.

The name and age for the 'Peter' node are returned because his name ends with 'ter'.

Table 143. Result

<table>
<thead>
<tr>
<th>n.name</th>
<th>n.age</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;Peter&quot;</td>
<td>35</td>
</tr>
</tbody>
</table>

Rows: 1

Substring search using **CONTAINS**

The **CONTAINS** operator is used to perform case-sensitive matching regardless of location within a string.

The name and age for the 'Peter' node are returned because his name contains with 'ete'.

Table 144. Result

<table>
<thead>
<tr>
<th>n.name</th>
<th>n.age</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;Peter&quot;</td>
<td>35</td>
</tr>
</tbody>
</table>

Rows: 1
String matching negation

Use the **NOT** keyword to exclude all matches on given string from your result:

```
MATCH (n:Person)
WHERE NOT n.name ENDS WITH 'y'
RETURN n.name, n.age
```

The name and age for the 'Peter' node are returned because his name does not end with 'y'.

Table 145. Result

<table>
<thead>
<tr>
<th>n.name</th>
<th>n.age</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;Peter&quot;</td>
<td>35</td>
</tr>
</tbody>
</table>

Rows: 1

9.6.4. Regular expressions

Cypher supports filtering using regular expressions. The regular expression syntax is inherited from the Java regular expressions. This includes support for flags that change how strings are matched, including case-insensitive (?i), multiline (?m) and dotall (?s). Flags are given at the beginning of the regular expression, for example ```MATCH (n) WHERE n.name =~ '(?i)Lon.*' RETURN n``` will return nodes with name 'London' or with name 'LonDoN'.

Matching using regular expressions

You can match on regular expressions by using `=~ 'regexp'`, like this:

```
MATCH (n:Person)
WHERE n.name =~ 'Tim.*'
RETURN n.name, n.age
```

The name and age for the 'Timothy' node are returned because his name starts with 'Tim'.

Table 146. Result

<table>
<thead>
<tr>
<th>n.name</th>
<th>n.age</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;Timothy&quot;</td>
<td>25</td>
</tr>
</tbody>
</table>

Rows: 1

Escaping in regular expressions

Characters like . or * have special meaning in a regular expression. To use these as ordinary characters, without special meaning, escape them.
The name, age and email for the 'Peter' node are returned because his email ends with '.com'.

Table 147. Result

<table>
<thead>
<tr>
<th>n.name</th>
<th>n.age</th>
<th>n.email</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;Peter&quot;</td>
<td>35</td>
<td>&quot;<a href="mailto:peter_n@example.com">peter_n@example.com</a>&quot;</td>
</tr>
</tbody>
</table>

Rows: 1

Case-insensitive regular expressions

By pre-pending a regular expression with (?i), the whole expression becomes case-insensitive.

The name and age for the 'Andy' node are returned because his name starts with 'AND' irrespective of casing.

Table 148. Result

<table>
<thead>
<tr>
<th>n.name</th>
<th>n.age</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;Andy&quot;</td>
<td>36</td>
</tr>
</tbody>
</table>

Rows: 1

9.6.5. Using path patterns in WHERE

Filter on patterns

Patterns are expressions in Cypher, expressions that return a list of paths. List expressions are also predicates — an empty list represents false, and a non-empty represents true.

So, patterns are not only expressions, they are also predicates. The only limitation to your pattern is that you must be able to express it in a single path. You cannot use commas between multiple paths like you do in MATCH. You can achieve the same effect by combining multiple patterns with AND.

Note that you cannot introduce new variables here. Although it might look very similar to the MATCH patterns, the WHERE clause is all about eliminating matched paths. MATCH (a)-[*]->(b) is very different from WHERE (a)-[*]->(b). The first will produce a path for every path it can find between a and b, whereas the latter will eliminate any matched paths where a and b do not have a directed relationship chain between them.
Query

MATCH
  (timothy:Person {name: 'Timothy'}),
  (other:Person)
WHERE other.name IN ['Andy', 'Peter'] AND (other)-->(timothy)
RETURN other.name, other.age

The name and age for nodes that have an outgoing relationship to the 'Timothy' node are returned.

Table 149. Result

<table>
<thead>
<tr>
<th>other.name</th>
<th>other.age</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;Andy&quot;</td>
<td>36</td>
</tr>
</tbody>
</table>

Rows: 1

Filter on patterns using **NOT**

The **NOT** operator can be used to exclude a pattern.

Query

MATCH
  (person:Person),
  (peter:Person {name: 'Peter'})
WHERE NOT (person)-->(peter)
RETURN person.name, person.age

Name and age values for nodes that do not have an outgoing relationship to the 'Peter' node are returned.

Table 150. Result

<table>
<thead>
<tr>
<th>person.name</th>
<th>person.age</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;Timothy&quot;</td>
<td>25</td>
</tr>
<tr>
<td>&quot;Peter&quot;</td>
<td>35</td>
</tr>
</tbody>
</table>

Rows: 2

Filter on patterns with properties

You can also add properties to your patterns:

Query

MATCH
  (n:Person)
WHERE (n)-[:KNOWS]->({name: 'Timothy'})
RETURN n.name, n.age

Finds all name and age values for nodes that have a **KNOWS** relationship to a node with the name 'Timothy'.

Table 151. Result

<table>
<thead>
<tr>
<th>n.name</th>
<th>n.age</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;Andy&quot;</td>
<td>36</td>
</tr>
</tbody>
</table>
Filter on relationship type

You can put the exact relationship type in the MATCH pattern, but sometimes you want to be able to do more advanced filtering on the type. You can use the special property `type` to compare the type with something else. In this example, the query does a regular expression comparison with the name of the relationship type.

Query

```
MATCH (n:Person)-[r]->()
WHERE n.name='Andy' AND type(r) =~ 'K.*'
RETURN type(r), r.since
```

This returns all relationships having a type whose name starts with 'K'.

Table 152. Result

<table>
<thead>
<tr>
<th>type(r)</th>
<th>r.since</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;KNOWS&quot;</td>
<td>1999</td>
</tr>
<tr>
<td>&quot;KNOWS&quot;</td>
<td>2012</td>
</tr>
</tbody>
</table>

An existential subquery can be used to find out if a specified pattern exists at least once in the data. It can be used in the same way as a path pattern but it allows you to use MATCH and WHERE clauses internally. A subquery has a scope, as indicated by the opening and closing braces, { and }. Any variable that is defined in the outside scope can be referenced inside the subquery’s own scope. Variables introduced inside the subquery are not part of the outside scope and therefore can’t be accessed on the outside. If the subquery evaluates even once to anything that is not null, the whole expression will become true. This also means that the system only needs to calculate the first occurrence where the subquery evaluates to something that is not null and can skip the rest of the work.

Syntax:

```
EXISTS {
  MATCH [Pattern]
  WHERE [Expression]
}
```

It is worth noting that the MATCH keyword can be omitted in subqueries and that the WHERE clause is optional.

9.6.6. Using existential subqueries in WHERE
Simple existential subquery

Variables introduced by the outside scope can be used in the inner MATCH clause. The following example shows this:

Query

```
MATCH (person:Person)
WHERE EXISTS {
    MATCH (person)-[:HAS_DOG]->(dog)
}
RETURN person.name AS name
```

Table 153. Result

<table>
<thead>
<tr>
<th>name</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;Andy&quot;</td>
</tr>
<tr>
<td>&quot;Peter&quot;</td>
</tr>
<tr>
<td>Rows: 2</td>
</tr>
</tbody>
</table>

Existential subquery with WHERE clause

A WHERE clause can be used in conjunction to the MATCH. Variables introduced by the MATCH clause and the outside scope can be used in this scope.

Query

```
MATCH (person:Person)
WHERE EXISTS {
    MATCH (person)-[:HAS_DOG]->(dog)
    WHERE person.name = dog.name
}
RETURN person.name AS name
```

Table 154. Result

<table>
<thead>
<tr>
<th>name</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;Andy&quot;</td>
</tr>
<tr>
<td>Rows: 1</td>
</tr>
</tbody>
</table>

Nesting existential subqueries

Existential subqueries can be nested like the following example shows. The nesting also affects the scopes. That means that it is possible to access all variables from inside the subquery which are either on the outside scope or defined in the very same subquery.
Query

MATCH (person:Person)
WHERE EXISTS (
    MATCH (person)-[:HAS_DOG]->(dog:Dog)
    WHERE EXISTS (
        MATCH (dog)-[:HAS_TOY]->(toy:Toy)
        WHERE toy.name = 'Banana'
    }
)
RETURN person.name AS name

Table 155. Result

<table>
<thead>
<tr>
<th>name</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;Peter&quot;</td>
</tr>
</tbody>
</table>

Rows: 1

9.6.7. Lists

**IN** operator

To check if an element exists in a list, you can use the **IN** operator.

Query

MATCH (a:Person)
WHERE a.name IN ['Peter', 'Timothy']
RETURN a.name, a.age

This query shows how to check if a property exists in a literal list.

Table 156. Result

<table>
<thead>
<tr>
<th>a.name</th>
<th>a.age</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;Timothy&quot;</td>
<td>25</td>
</tr>
<tr>
<td>&quot;Peter&quot;</td>
<td>35</td>
</tr>
</tbody>
</table>

Rows: 2

9.6.8. Missing properties and values

Default to **false** if property is missing

As missing properties evaluate to **null**, the comparison in the example will evaluate to **false** for nodes without the **belt** property.

Query

MATCH (n:Person)
WHERE n.belt = 'white'
RETURN n.name, n.age, n.belt
Only the name, age and belt values of nodes with white belts are returned.

Table 157. Result

<table>
<thead>
<tr>
<th>n.name</th>
<th>n.age</th>
<th>n.belt</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;Andy&quot;</td>
<td>36</td>
<td>&quot;white&quot;</td>
</tr>
</tbody>
</table>

Rows: 1

Default to true if property is missing

If you want to compare a property on a node or relationship, but only if it exists, you can compare the property against both the value you are looking for and null, like:

Query

```sql
MATCH (n:Person)
WHERE n.belt = 'white' OR n.belt IS NULL
RETURN n.name, n.age, n.belt
ORDER BY n.name
```

This returns all values for all nodes, even those without the belt property.

Table 158. Result

<table>
<thead>
<tr>
<th>n.name</th>
<th>n.age</th>
<th>n.belt</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;Andy&quot;</td>
<td>36</td>
<td>&quot;white&quot;</td>
</tr>
<tr>
<td>&quot;Peter&quot;</td>
<td>35</td>
<td>&lt;null&gt;</td>
</tr>
<tr>
<td>&quot;Timothy&quot;</td>
<td>25</td>
<td>&lt;null&gt;</td>
</tr>
</tbody>
</table>

Rows: 3

Filter on null

Sometimes you might want to test if a value or a variable is null. This is done just like SQL does it, using IS NULL. Also like SQL, the negative is IS NOT NULL, although NOT(IS NULL x) also works.

Query

```sql
MATCH (person:Person)
WHERE person.name = 'Peter' AND person.belt IS NULL
RETURN person.name, person.age, person.belt
```

The name and age values for nodes that have name 'Peter' but no belt property are returned.

Table 159. Result

<table>
<thead>
<tr>
<th>person.name</th>
<th>person.age</th>
<th>person.belt</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;Peter&quot;</td>
<td>35</td>
<td>&lt;null&gt;</td>
</tr>
</tbody>
</table>

Rows: 1
9.6.9. Using ranges

Simple range

To check for an element being inside a specific range, use the inequality operators <, <=, >=, >.

Query

```
MATCH (a:Person)
WHERE a.name >= 'Peter'
RETURN a.name, a.age
```

The name and age values of nodes having a name property lexicographically greater than or equal to 'Peter' are returned.

Table 160. Result

<table>
<thead>
<tr>
<th>a.name</th>
<th>a.age</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;Timothy&quot;</td>
<td>25</td>
</tr>
<tr>
<td>&quot;Peter&quot;</td>
<td>35</td>
</tr>
</tbody>
</table>

Rows: 2

Composite range

Several inequalities can be used to construct a range.

Query

```
MATCH (a:Person)
WHERE a.name > 'Andy' AND a.name < 'Timothy'
RETURN a.name, a.age
```

The name and age values of nodes having a name property lexicographically between 'Andy' and 'Timothy' are returned.

Table 161. Result

<table>
<thead>
<tr>
<th>a.name</th>
<th>a.age</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;Peter&quot;</td>
<td>35</td>
</tr>
</tbody>
</table>

Rows: 1

9.7. ORDER BY

ORDER BY is a sub-clause following RETURN or WITH, and it specifies that the output should be sorted and how.

- Introduction
- Order nodes by property
9.7.1. Introduction

ORDER BY relies on comparisons to sort the output, see Ordering and comparison of values. You can sort on many different values, e.g. node/relationship properties, the node/relationship ids, or on most expressions. If you do not specify what to sort on, there is a risk that the results are arbitrarily sorted and therefore it is best practice to be specific when using ORDER BY.

In terms of scope of variables, ORDER BY follows special rules, depending on if the projecting RETURN or WITH clause is either aggregating or DISTINCT. If it is an aggregating or DISTINCT projection, only the variables available in the projection are available. If the projection does not alter the output cardinality (which aggregation and DISTINCT do), variables available from before the projecting clause are also available. When the projection clause shadows already existing variables, only the new variables are available.

Lastly, it is not allowed to use aggregating expressions in the ORDER BY sub-clause if they are not also listed in the projecting clause. This last rule is to make sure that ORDER BY does not change the results, only the order of them.

The performance of Cypher queries using ORDER BY on node properties can be influenced by the existence and use of an index for finding the nodes. If the index can provide the nodes in the order requested in the query, Cypher can avoid the use of an expensive Sort operation. Read more about this capability in The use of indexes.

The following graph is used for the examples below:

Strings that contain special characters can have inconsistent or non-deterministic ordering in Neo4j. For details, see Sorting of special characters.
9.7.2. Order nodes by property

**ORDER BY** is used to sort the output.

**Query**

```cypher
MATCH (n)
RETURN n.name, n.age
ORDER BY n.name
```

The nodes are returned, sorted by their name.

**Table 162. Result**

<table>
<thead>
<tr>
<th>n.name</th>
<th>n.age</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;A&quot;</td>
<td>34</td>
</tr>
<tr>
<td>&quot;B&quot;</td>
<td>36</td>
</tr>
<tr>
<td>&quot;C&quot;</td>
<td>32</td>
</tr>
</tbody>
</table>

Rows: 3

9.7.3. Order nodes by multiple properties

You can order by multiple properties by stating each variable in the **ORDER BY** clause. Cypher will sort the result by the first variable listed, and for equals values, go to the next property in the **ORDER BY** clause, and so on.

**Query**

```cypher
MATCH (n)
RETURN n.name, n.age
ORDER BY n.age, n.name
```

This returns the nodes, sorted first by their age, and then by their name.

**Table 163. Result**

<table>
<thead>
<tr>
<th>n.name</th>
<th>n.age</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;C&quot;</td>
<td>32</td>
</tr>
<tr>
<td>&quot;A&quot;</td>
<td>34</td>
</tr>
<tr>
<td>&quot;B&quot;</td>
<td>36</td>
</tr>
</tbody>
</table>

Rows: 3

9.7.4. Order nodes by id

**ORDER BY** is used to sort the output.
MATCH (n)
RETURN n.name, n.age
ORDER BY id(n)

The nodes are returned, sorted by their internal id.

Table 164. Result

<table>
<thead>
<tr>
<th>n.name</th>
<th>n.age</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;A&quot;</td>
<td>34</td>
</tr>
<tr>
<td>&quot;B&quot;</td>
<td>36</td>
</tr>
<tr>
<td>&quot;C&quot;</td>
<td>32</td>
</tr>
</tbody>
</table>

Rows: 3

Keep in mind that Neo4j reuses its internal ids when nodes and relationships are deleted. This means that applications using, and relying on, internal Neo4j ids, are brittle or at risk of making mistakes. It is therefore recommended to use application-generated ids instead.

9.7.5. Order nodes by expression

ORDER BY is used to sort the output.

Query

MATCH (n)
RETURN n.name, n.age, n.length
ORDER BY keys(n)

The nodes are returned, sorted by their properties.

Table 165. Result

<table>
<thead>
<tr>
<th>n.name</th>
<th>n.age</th>
<th>n.length</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;B&quot;</td>
<td>36</td>
<td>&lt;null&gt;</td>
</tr>
<tr>
<td>&quot;A&quot;</td>
<td>34</td>
<td>170</td>
</tr>
<tr>
<td>&quot;C&quot;</td>
<td>32</td>
<td>185</td>
</tr>
</tbody>
</table>

Rows: 3

9.7.6. Order nodes in descending order

By adding DESCENDING after the variable to sort on, the sort will be done in reverse order.
The example returns the nodes, sorted by their name in reverse order.

Table 166. Result

<table>
<thead>
<tr>
<th>n.name</th>
<th>n.age</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;C&quot;</td>
<td>32</td>
</tr>
<tr>
<td>&quot;B&quot;</td>
<td>36</td>
</tr>
<tr>
<td>&quot;A&quot;</td>
<td>34</td>
</tr>
</tbody>
</table>

Rows: 3

9.7.7. Ordering **null**

When sorting the result set, **null** will always come at the end of the result set for ascending sorting, and first when doing descending sort.

Table 167. Result

<table>
<thead>
<tr>
<th>n.length</th>
<th>n.name</th>
<th>n.age</th>
</tr>
</thead>
<tbody>
<tr>
<td>170</td>
<td>&quot;A&quot;</td>
<td>34</td>
</tr>
<tr>
<td>185</td>
<td>&quot;C&quot;</td>
<td>32</td>
</tr>
<tr>
<td>&lt;null&gt;</td>
<td>&quot;B&quot;</td>
<td>36</td>
</tr>
</tbody>
</table>

Rows: 3

9.7.8. Ordering in a **WITH** clause

When **ORDER BY** is present on a **WITH** clause, the immediately following clause will receive records in the specified order. The order is not guaranteed to be retained after the following clause, unless that also has an **ORDER BY** subclause. The ordering guarantee can be useful to exploit by operations which depend on the order in which they consume values. For example, this can be used to control the order of items in the list produced by the **collect()** aggregating function. The **MERGE** and **SET** clauses also have ordering dependencies which can be controlled this way.
The list of names built from the `collect` aggregating function contains the names in order of the `age` property.

**Table 168. Result**

<table>
<thead>
<tr>
<th>names</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;C&quot;,&quot;A&quot;,&quot;B&quot;</td>
</tr>
</tbody>
</table>

Rows: 1

### 9.8. SKIP

`SKIP` defines from which row to start including the rows in the output.

- Introduction
- Skip first three rows
- Return middle two rows
- Using an expression with `SKIP` to return a subset of the rows

#### 9.8.1. Introduction

By using `SKIP`, the result set will get trimmed from the top. Please note that no guarantees are made on the order of the result unless the query specifies the `ORDER BY` clause. `SKIP` accepts any expression that evaluates to a positive integer — however the expression cannot refer to nodes or relationships.

#### 9.8.2. Skip first three rows

To return a subset of the result, starting from the fourth result, use the following syntax:
Query

```plaintext
MATCH (n)
RETURN n.name
ORDER BY n.name
SKIP 3
```

The first three nodes are skipped, and only the last two are returned in the result.

Table 169. Result

<table>
<thead>
<tr>
<th>n.name</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;D&quot;</td>
</tr>
<tr>
<td>&quot;E&quot;</td>
</tr>
</tbody>
</table>
Rows: 2

### 9.8.3. Return middle two rows

To return a subset of the result, starting from somewhere in the middle, use this syntax:

Query

```plaintext
MATCH (n)
RETURN n.name
ORDER BY n.name
SKIP 1
LIMIT 2
```

Two nodes from the middle are returned.

Table 170. Result

<table>
<thead>
<tr>
<th>n.name</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;B&quot;</td>
</tr>
<tr>
<td>&quot;C&quot;</td>
</tr>
</tbody>
</table>
Rows: 2

### 9.8.4. Using an expression with `SKIP` to return a subset of the rows

Skip accepts any expression that evaluates to a positive integer as long as it is not referring to any external variables:

Query

```plaintext
MATCH (n)
RETURN n.name
ORDER BY n.name
SKIP 1 + toInteger(3*rand())
```

Skip the first row plus randomly 0, 1, or 2. So randomly skip 1, 2, or 3 rows.

Table 171. Result

<table>
<thead>
<tr>
<th>n.name</th>
</tr>
</thead>
</table>

| Rows: 2 |
9.9. LIMIT

**LIMIT** constrains the number of returned rows.

- **Introduction**
- **Return a subset of the rows**
- **Using an expression with LIMIT to return a subset of the rows**
- **LIMIT will not stop side effects**

### 9.9.1. Introduction

*LIMIT* accepts any expression that evaluates to a positive integer — however the expression cannot refer to nodes or relationships.

![Graph](image)

### 9.9.2. Return a limited subset of the rows

To return a limited subset of the rows, use this syntax:

**Query**

```plaintext
MATCH (n)
RETURN n.name
ORDER BY n.name
LIMIT 3
```

Limit to 3 rows by the example query.

**Table 172. Result**

<table>
<thead>
<tr>
<th>n.name</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;A&quot;</td>
</tr>
<tr>
<td>&quot;B&quot;</td>
</tr>
</tbody>
</table>
9.9.3. Using an expression with \texttt{LIMIT} to return a subset of the rows

Limit accepts any expression that evaluates to a positive integer as long as it is not referring to any external variables:

\begin{verbatim}
MATCH (n)
RETURN n.name
ORDER BY n.name
LIMIT 1 + toInteger(3 * rand())
\end{verbatim}

Limit 1 row plus randomly 0, 1, or 2. So randomly limit to 1, 2, or 3 rows.

Table 173. Result

<table>
<thead>
<tr>
<th>n.name</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;A&quot;</td>
</tr>
<tr>
<td>&quot;B&quot;</td>
</tr>
</tbody>
</table>

Rows: 2

9.9.4. \texttt{LIMIT} will not stop side effects

The use of \texttt{LIMIT} in a query will not stop side effects, like \texttt{CREATE}, \texttt{DELETE} or \texttt{SET}, from happening if the limit is in the same query part as the side effect. This behaviour was undefined in versions before 4.3.

\begin{verbatim}
CREATE (n)
RETURN n
LIMIT 0
\end{verbatim}

This query returns nothing, but creates one node:

Table 174. Result

(\textit{empty result})

Rows: 0
Nodes created: 1

\begin{verbatim}
MATCH (n {name: 'A'})
SET n.age = 60
RETURN n
LIMIT 0
\end{verbatim}
This query returns nothing, but writes one property:

Table 175. Result

<table>
<thead>
<tr>
<th>(empty result)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Rows: 0</td>
</tr>
<tr>
<td>Properties set: 1</td>
</tr>
</tbody>
</table>

If we want to limit the number of updates we can split the query using the `WITH` clause:

Query

```
MATCH (n)
WITH n LIMIT 1
SET n.locked = true
RETURN n
```

Writes `locked` property on one node and return that node:

Table 176. Result

<table>
<thead>
<tr>
<th>n</th>
</tr>
</thead>
<tbody>
<tr>
<td>Node[0]{locked:true,name:&quot;A&quot;}</td>
</tr>
</tbody>
</table>

| Rows: 1 |
| Properties set: 1 |

9.10. CREATE

The `CREATE` clause is used to create nodes and relationships.

- Create nodes
  - Create single node
  - Create multiple nodes
  - Create a node with a label
  - Create a node with multiple labels
  - Create node and add labels and properties
  - Return created node
- Create relationships
  - Create a relationship between two nodes
  - Create a relationship and set properties
- Create a full path
- Use parameters with `CREATE`
  - Create node with a parameter for the properties
  - Create multiple nodes with a parameter for their properties
In the `CREATE` clause, patterns are used extensively. Read Patterns for an introduction.

9.10.1. Create nodes

Create single node

Creating a single node is done by issuing the following query:

Query

```
CREATE (n)
```

Table 177. Result

(Empty result)

Rows: 0
Nodes created: 1

Create multiple nodes

Creating multiple nodes is done by separating them with a comma.

Query

```
CREATE (n), (m)
```

Table 178. Result

(Empty result)

Rows: 0
Nodes created: 2

Create a node with a label

To add a label when creating a node, use the syntax below:

Query

```
CREATE (n:Person)
```

Table 179. Result

(Empty result)

Rows: 0
Nodes created: 1
Labels added: 1
Create a node with multiple labels

To add labels when creating a node, use the syntax below. In this case, we add two labels.

Query

```
CREATE (n:Person:Swedish)
```

Table 180. Result

(empty result)

Rows: 0
Nodes created: 1
Labels added: 2

Create node and add labels and properties

When creating a new node with labels, you can add properties at the same time.

Query

```
CREATE (n:Person {
  name: 'Andy',
  title: 'Developer'
})
```

Table 181. Result

(empty result)

Rows: 0
Nodes created: 1
Properties set: 2
Labels added: 1

Return created node

Creating a single node is done by issuing the following query:

Query

```
CREATE (a {
  name: 'Andy'
})
RETURN a.name
```

The name of the newly-created node is returned.

Table 182. Result

<table>
<thead>
<tr>
<th>a.name</th>
<th>&quot;Andy&quot;</th>
</tr>
</thead>
</table>

Rows: 1
Nodes created: 1
Properties set: 1
9.10.2. Create relationships

Create a relationship between two nodes

To create a relationship between two nodes, we first get the two nodes. Once the nodes are loaded, we simply create a relationship between them.

Query

```sql
MATCH
  (a:Person),
  (b:Person)
WHERE a.name = 'A' AND b.name = 'B'
CREATE (a)-[r:RELTYPE]->(b)
RETURN type(r)
```

The created relationship is returned by the query.

Table 183. Result

<table>
<thead>
<tr>
<th>type(r)</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;RELTYPE&quot;</td>
</tr>
</tbody>
</table>

Rows: 1
Relationships created: 1

Create a relationship and set properties

Setting properties on relationships is done in a similar manner to how it’s done when creating nodes. Note that the values can be any expression.

Query

```sql
MATCH
  (a:Person),
  (b:Person)
WHERE a.name = 'A' AND b.name = 'B'
CREATE (a)-[r:RELTYPE {name: a.name + '<->' + b.name}]->(b)
RETURN type(r), r.name
```

The type and name of the newly-created relationship is returned by the example query.

Table 184. Result

<table>
<thead>
<tr>
<th>type(r)</th>
<th>r.name</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;RELTYPE&quot;</td>
<td>&quot;A&lt;-&gt;B&quot;</td>
</tr>
</tbody>
</table>

Rows: 1
Relationships created: 1
Properties set: 1

9.10.3. Create a full path

When you use `CREATE` and a pattern, all parts of the pattern that are not already in scope at this time will
be created.

Query

```
CREATE p = (andy {name: 'Andy'})-[ :WORKS_AT ]->(neo)<-[ :WORKS_AT ]-(michael {name: 'Michael'})
RETURN p
```

This query creates three nodes and two relationships in one go, assigns it to a path variable, and returns it.

Table 185. Result

<table>
<thead>
<tr>
<th>p</th>
</tr>
</thead>
<tbody>
<tr>
<td>(2)-[ :WORKS_AT,0 ]-&gt;(3)&lt;-[ :WORKS_AT,1 ]-(4)</td>
</tr>
</tbody>
</table>

Rows: 1
Nodes created: 3
Relationships created: 2
Properties set: 2

9.10.4. Use parameters with `CREATE`

Create node with a parameter for the properties

You can also create a graph entity from a map. All the key/value pairs in the map will be set as properties on the created relationship or node. In this case we add a `Person` label to the node as well.

```
Parameters
{
  "props" : {
    "name" : "Andy",
    "position" : "Developer"
  }
}
```

Query

```
CREATE (n:Person $props)
RETURN n
```

Table 186. Result

<table>
<thead>
<tr>
<th>n</th>
</tr>
</thead>
<tbody>
<tr>
<td>Node[2]{name:&quot;Andy&quot;,position:&quot;Developer&quot;}</td>
</tr>
</tbody>
</table>

Rows: 1
Nodes created: 1
Properties set: 2
Labels added: 1

Create multiple nodes with a parameter for their properties

By providing Cypher an array of maps, it will create a node for each map.
9.11. DELETE

The DELETE clause is used to delete nodes, relationships or paths.

- Introduction
- Delete a single node
- Delete all nodes and relationships
- Delete a node with all its relationships
- Delete relationships only

9.11.1. Introduction

For removing properties and labels, see REMOVE. Remember that you cannot delete a node without also deleting relationships that start or end on said node. Either explicitly delete the relationships, or use DETACH DELETE.

The examples start out with the following database:
9.11.2. Delete single node

To delete a node, use the `DELETE` clause.

Query

```plaintext
MATCH (n:Person {name: 'UNKNOWN'})
DELETE n
```

Table 188. Result

(Empty result)

Rows: 0
Nodes deleted: 1

9.11.3. Delete all nodes and relationships

This query is not for deleting large amounts of data, but is useful when experimenting with small example data sets.

Query

```plaintext
MATCH (n)
DETACH DELETE n
```

Table 189. Result

(Empty result)

Rows: 0
Nodes deleted: 4
Relationships deleted: 2

9.11.4. Delete a node with all its relationships

When you want to delete a node and any relationship going to or from it, use `DETACH DELETE`.

Query

```plaintext
MATCH (n {name: 'Andy'})
DETACH DELETE n
```
9.11.5. Delete relationships only

It is also possible to delete relationships only, leaving the node(s) otherwise unaffected.

Query

```
MATCH (n {name: 'Andy'})-[r:KNOWS]->()
DELETE r
```

This deletes all outgoing KNOWS relationships from the node with the name 'Andy'.

9.12. SET

*The SET clause is used to update labels on nodes and properties on nodes and relationships.*

- Introduction
- Set a property
- Update a property
- Remove a property
- Copy properties between nodes and relationships
- Replace all properties using a map and =
- Remove all properties using an empty map and =
- Mutate specific properties using a map and +=
- Set multiple properties using one SET clause
- Set a property using a parameter
- Set all properties using a parameter
Set a label on a node
Set multiple labels on a node

9.12.1. Introduction

`SET` can be used with a map — provided as a literal, a parameter, or a node or relationship — to set properties.

Setting labels on a node is an idempotent operation — nothing will occur if an attempt is made to set a label on a node that already has that label. The query statistics will state whether any updates actually took place.

The examples use this graph as a starting point:

![Graph](image_url)

9.12.2. Set a property

Use `SET` to set a property on a node or relationship:

**Query**

```plaintext
MATCH (n { name: 'Andy'})
SET n.surname = 'Taylor'
RETURN n.name, n.surname
```

The newly-changed node is returned by the query.

**Table 192. Result**

<table>
<thead>
<tr>
<th>n.name</th>
<th>n.surname</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;Andy&quot;</td>
<td>&quot;Taylor&quot;</td>
</tr>
</tbody>
</table>

Rows: 1
Properties set: 1

It is possible to set a property on a node or relationship using more complex expressions. For instance, in contrast to specifying the node directly, the following query shows how to set a property for a node selected by an expression:
Query

MATCH (n {name: 'Andy'})
SET (CASE WHEN n.age = 36 THEN n END).worksIn = 'Malmo'
RETURN n.name, n.worksIn

Table 193. Result

<table>
<thead>
<tr>
<th>n.name</th>
<th>n.worksIn</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;Andy&quot;</td>
<td>&quot;Malmo&quot;</td>
</tr>
</tbody>
</table>

Rows: 1
Properties set: 1

No action will be taken if the node expression evaluates to null, as shown in this example:

Query

MATCH (n {name: 'Andy'})
SET (CASE WHEN n.age = 55 THEN n END).worksIn = 'Malmo'
RETURN n.name, n.worksIn

As no node matches the CASE expression, the expression returns a null. As a consequence, no updates occur, and therefore no worksIn property is set.

Table 194. Result

<table>
<thead>
<tr>
<th>n.name</th>
<th>n.worksIn</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;Andy&quot;</td>
<td>&lt;null&gt;</td>
</tr>
</tbody>
</table>

Rows: 1

9.12.3. Update a property

SET can be used to update a property on a node or relationship. This query forces a change of type in the age property:

Query

MATCH (n {name: 'Andy'})
SET n.age = toString(n.age)
RETURN n.name, n.age

The age property has been converted to the string '36'.

Table 195. Result

<table>
<thead>
<tr>
<th>n.name</th>
<th>n.age</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;Andy&quot;</td>
<td>&quot;36&quot;</td>
</tr>
</tbody>
</table>

Rows: 1
Properties set: 1
9.12.4. Remove a property

Although REMOVE is normally used to remove a property, it’s sometimes convenient to do it using the SET command. A case in point is if the property is provided by a parameter.

Query

```
MATCH (n { name: 'Andy' })
SET n.name = null
RETURN n.name, n.age
```

The name property is now missing.

Table 196. Result

<table>
<thead>
<tr>
<th>n.name</th>
<th>n.age</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;null&gt;</td>
<td>36</td>
</tr>
</tbody>
</table>

Rows: 1
Properties set: 1

9.12.5. Copy properties between nodes and relationships

SET can be used to copy all properties from one node or relationship to another. This will remove all other properties on the node or relationship being copied to.

Query

```
MATCH (at { name: 'Andy' }),
(pn { name: 'Peter' })
SET at = pn
RETURN at.name, at.age, at.hungry, pn.name, pn.age
```

The 'Andy' node has had all its properties replaced by the properties of the 'Peter' node.

Table 197. Result

<table>
<thead>
<tr>
<th>at.name</th>
<th>at.age</th>
<th>at.hungry</th>
<th>pn.name</th>
<th>pn.age</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;Peter&quot;</td>
<td>34</td>
<td>&lt;null&gt;</td>
<td>&quot;Peter&quot;</td>
<td>34</td>
</tr>
</tbody>
</table>

Rows: 1
Properties set: 3

9.12.6. Replace all properties using a map and =

The property replacement operator = can be used with SET to replace all existing properties on a node or relationship with those provided by a map:

Query

```
MATCH (p { name: 'Peter' })
SET p = { name: 'Peter Smith', position: 'Entrepreneur'}
RETURN p.name, p.age, p.position
```
This query updated the name property from Peter to Peter Smith, deleted the age property, and added the position property to the 'Peter' node.

Table 198. Result

<table>
<thead>
<tr>
<th>p.name</th>
<th>p.age</th>
<th>p.position</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;Peter Smith&quot;</td>
<td>&lt;null&gt;</td>
<td>&quot;Entrepreneur&quot;</td>
</tr>
</tbody>
</table>

Rows: 1  
Properties set: 3

9.12.7. Remove all properties using an empty map and =

All existing properties can be removed from a node or relationship by using SET with = and an empty map as the right operand:

Query

```
MATCH (p {name: 'Peter'})
SET p = {}
RETURN p.name, p.age
```

This query removed all the existing properties — namely, name and age — from the 'Peter' node.

Table 199. Result

<table>
<thead>
<tr>
<th>p.name</th>
<th>p.age</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;null&gt;</td>
<td>&lt;null&gt;</td>
</tr>
</tbody>
</table>

Rows: 1  
Properties set: 2

9.12.8. Mutate specific properties using a map and +=

The property mutation operator += can be used with SET to mutate properties from a map in a fine-grained fashion:

- Any properties in the map that are not on the node or relationship will be added.
- Any properties not in the map that are on the node or relationship will be left as is.
- Any properties that are in both the map and the node or relationship will be replaced in the node or relationship. However, if any property in the map is null, it will be removed from the node or relationship.

Query

```
MATCH (p {name: 'Peter'})
SET p += {age: 38, hungry: true, position: 'Entrepreneur'}
RETURN p.name, p.age, p.hungry, p.position
```

This query left the name property unchanged, updated the age property from 34 to 38, and added the hungry and position properties to the 'Peter' node.
In contrast to the property replacement operator =, providing an empty map as the right operand to += will not remove any existing properties from a node or relationship. In line with the semantics detailed above, passing in an empty map with += will have no effect:

Query

```sql
MATCH (p { name: 'Peter'})
SET p += {}
RETURN p.name, p.age
```

9.12.9. Set multiple properties using one SET clause

Set multiple properties at once by separating them with a comma:

Query

```sql
MATCH (n { name: 'Andy'})
SET n.position = 'Developer', n.surname = 'Taylor'
```

9.12.10. Set a property using a parameter

Use a parameter to set the value of a property:

Parameters

```json
{
    "surname": "Taylor"
}
```
Query

```
MATCH (n { name: 'Andy' })
SET n.surname = $surname
RETURN n.name, n.surname
```

A `surname` property has been added to the 'Andy' node.

Table 203. Result

<table>
<thead>
<tr>
<th>n.name</th>
<th>n.surname</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;Andy&quot;</td>
<td>&quot;Taylor&quot;</td>
</tr>
</tbody>
</table>

Rows: 1
Properties set: 1

9.12.11. Set all properties using a parameter

This will replace all existing properties on the node with the new set provided by the parameter.

Parameters

```
{
  "props": {
    "name": "Andy",
    "position": "Developer"
  }
}
```

Query

```
MATCH (n { name: 'Andy' })
SET n = $props
RETURN n.name, n.position, n.age, n.hungry
```

The 'Andy' node has had all its properties replaced by the properties in the `props` parameter.

Table 204. Result

<table>
<thead>
<tr>
<th>n.name</th>
<th>n.position</th>
<th>n.age</th>
<th>n.hungry</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;Andy&quot;</td>
<td>&quot;Developer&quot;</td>
<td>&lt;null&gt;</td>
<td>&lt;null&gt;</td>
</tr>
</tbody>
</table>

Rows: 1
Properties set: 4

9.12.12. Set a label on a node

Use `SET` to set a label on a node:

Query

```
MATCH (n { name: 'Stefan' })
SET n: German
RETURN n.name, labels(n) AS labels
```
The newly-labeled node is returned by the query.

Table 205. Result

<table>
<thead>
<tr>
<th>n.name</th>
<th>labels</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;Stefan&quot;</td>
<td>[&quot;German&quot;]</td>
</tr>
</tbody>
</table>

Rows: 1
Labels added: 1

9.12.13. Set multiple labels on a node

Set multiple labels on a node with SET and use : to separate the different labels:

Query

```
MATCH (n { name: 'George'})
SET n:Swedish:Bossman
RETURN n.name, labels(n) AS labels
```

The newly-labeled node is returned by the query.

Table 206. Result

<table>
<thead>
<tr>
<th>n.name</th>
<th>labels</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;George&quot;</td>
<td>[&quot;Swedish&quot;,&quot;Bossman&quot;]</td>
</tr>
</tbody>
</table>

Rows: 1
Labels added: 2

9.13. REMOVE

The REMOVE clause is used to remove properties from nodes and relationships, and to remove labels from nodes.

- Introduction
- Remove a property
- Remove all properties
- Remove a label from a node
- Remove multiple labels from a node

9.13.1. Introduction

For deleting nodes and relationships, see DELETE.
Removing labels from a node is an idempotent operation: if you try to remove a label from a node that does not have that label on it, nothing happens. The query statistics will tell you if something needed to be done or not.

The examples use the following database:

![Graph diagram](image)

**Graph**

### 9.13.2. Remove a property

Neo4j doesn’t allow storing null in properties. Instead, if no value exists, the property is just not there. So, REMOVE is used to remove a property value from a node or a relationship.

**Query**

```cypher
MATCH (a { name: 'Andy' })
REMOVE a.age
RETURN a.name, a.age
```

The node is returned, and no property age exists on it.

**Table 207. Result**

<table>
<thead>
<tr>
<th>a.name</th>
<th>a.age</th>
</tr>
</thead>
<tbody>
<tr>
<td>Andy</td>
<td>&lt;null&gt;</td>
</tr>
</tbody>
</table>

Rows: 1
Properties set: 1

### 9.13.3. Remove all properties

REMOVE cannot be used to remove all existing properties from a node or relationship. Instead, using SET with = and an empty map as the right operand will clear all properties from the node or relationship.

### 9.13.4. Remove a label from a node

To remove labels, you use REMOVE.

**Query**

```cypher
MATCH (n { name: 'Peter' })
REMOVE n:German
RETURN n.name, labels(n)
```
9.13.5. Remove multiple labels from a node

To remove multiple labels, you use **REMOVE**.

**Query**

```cypher
MATCH (n {name: 'Peter'})
REMOVE n:German, Swedish
RETURN n.name, labels(n)
```

**Table 209. Result**

<table>
<thead>
<tr>
<th>n.name</th>
<th>labels(n)</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;Peter&quot;</td>
<td>[]</td>
</tr>
</tbody>
</table>

Rows: 1
Labels removed: 2

9.14. FOREACH

The **FOREACH** clause is used to update data within a collection whether components of a path, or result of aggregation.

9.14.1. Introduction

Lists and paths are key concepts in Cypher. The **FOREACH** clause can be used to update data, such as executing update commands on elements in a path, or on a list created by aggregation.

The variable context within the **FOREACH** parenthesis is separate from the one outside it. This means that if you **CREATE** a node variable within a **FOREACH**, you will not be able to use it outside of the foreach statement, unless you match to find it.

Within the **FOREACH** parentheses, you can do any of the updating commands — **SET**, **REMOVE**, **CREATE**, **MERGE**, **DELETE**, and **FOREACH**.

If you want to execute an additional **MATCH** for each element in a list then the **UNWIND** clause would be a more appropriate command.
9.14.2. Mark all nodes along a path

This query will set the property `marked` to `true` on all nodes along a path.

**Query**

```
MATCH p=(start)-[*]->(finish)
WHERE start.name = 'A' AND finish.name = 'D'
FOREACH (n IN nodes(p) | SET n.marked = true)
```

**Table 210. Result**

(empty result)

Rows: 0
Properties set: 4

9.15. MERGE

The **MERGE** clause ensures that a pattern exists in the graph. Either the pattern already exists, or it needs to be created.

- **Introduction**
- **Merge nodes**
  - Merge single node with a label
  - Merge single node with properties
  - Merge single node specifying both label and property
  - Merge single node derived from an existing node property
- **Use ON CREATE and ON MATCH**
  - Merge with ON CREATE
- Merge with **ON MATCH**
- Merge with **ON CREATE** and **ON MATCH**
- Merge with **ON MATCH** setting multiple properties

**Merge relationships**
- Merge on a relationship
- Merge on multiple relationships
- Merge on an undirected relationship
- Merge on a relationship between two existing nodes
- Merge on a relationship between an existing node and a merged node derived from a node property

**Using unique constraints with **MERGE**
- Merge using unique constraints creates a new node if no node is found
- Merge using unique constraints matches an existing node
- Merge with unique constraints and partial matches
- Merge with unique constraints and conflicting matches

**Using map parameters with **MERGE**

### 9.15.1. Introduction

**MERGE** either matches existing nodes and binds them, or it creates new data and binds that. It's like a combination of **MATCH** and **CREATE** that additionally allows you to specify what happens if the data was matched or created.

For example, you can specify that the graph must contain a node for a user with a certain name. If there isn't a node with the correct name, a new node will be created and its name property set.

For performance reasons, creating a schema index on the label or property is highly recommended when using **MERGE**. See [Indexes for search performance](#) for more information.

When using **MERGE** on full patterns, the behavior is that either the whole pattern matches, or the whole pattern is created. **MERGE** will not partially use existing patterns — it is all or nothing. If partial matches are needed, this can be accomplished by splitting a pattern up into multiple **MERGE** clauses.

Under concurrent updates, **MERGE** only guarantees existence of the **MERGE** pattern, but not uniqueness. To guarantee uniqueness of nodes with certain properties, a **unique constraint** should be used. See [Using unique constraints with **MERGE**](#) to see how **MERGE** can be used in combination with a unique constraint.

As with **MATCH**, **MERGE** can match multiple occurrences of a pattern. If there are multiple matches, they will all be passed on to later stages of the query.
The last part of **MERGE** is the **ON_CREATE** and **ON_MATCH**. These allow a query to express additional changes to the properties of a node or relationship, depending on if the element was matched (**MATCH**) in the database or if it was created (**CREATE**).

The following graph is used for the examples below:

![Graph Diagram]

**Graph**

### 9.15.2. Merge nodes

#### Merge single node with a label

Merging a single node with the given label.

**Query**

```sql
MERGE (robert: Critic) 
RETURN robert, labels(robert)
```

A new node is created because there are no nodes labeled **Critic** in the database.

**Table 211. Result**

<table>
<thead>
<tr>
<th>robert</th>
<th>labels(robert)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Node[7]{}</td>
<td>[&quot;Critic&quot;]</td>
</tr>
</tbody>
</table>

Rows: 1
Nodes created: 1
Labels added: 1

#### Merge single node with properties

Merging a single node with properties where not all properties match any existing node.

**Query**

```sql
MERGE (charlie {name: 'Charlie Sheen', age: 10}) 
RETURN charlie
```

A new node with the name 'Charlie Sheen' will be created since not all properties matched the existing 'Charlie Sheen' node.

**Table 212. Result**

<table>
<thead>
<tr>
<th>charlie</th>
</tr>
</thead>
<tbody>
<tr>
<td>Node[7]{age:10,name:&quot;Charlie Sheen&quot;}</td>
</tr>
</tbody>
</table>
Merge single node specifying both label and property

Merging a single node with both label and property matching an existing node.

Query

```mercury
MERGE (michael:Person {name: 'Michael Douglas'})
RETURN michael.name, michael.bornIn
```

'Michael Douglas' will be matched and the `name` and `bornIn` properties returned.

Table 213. Result

<table>
<thead>
<tr>
<th>michael.name</th>
<th>michael.bornIn</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;Michael Douglas&quot;</td>
<td>&quot;New Jersey&quot;</td>
</tr>
</tbody>
</table>

Rows: 1

As mentioned previously, `MERGE` queries can greatly benefit from schema indexes. In this example, the following would significantly improve the performance of the `MERGE` clause:

```mercury
CREATE INDEX PersonIndex FOR (n:Person) ON (n.name)
```

Merge single node derived from an existing node property

For some property 'p' in each bound node in a set of nodes, a single new node is created for each unique value for 'p'.

Query

```mercury
MATCH (person:Person)
MERGE (city:City {name: person.bornIn})
RETURN person.name, person.bornIn, city
```

Three nodes labeled `City` are created, each of which contains a `name` property with the value of 'New York', 'Ohio', and 'New Jersey', respectively. Note that even though the `MATCH` clause results in three bound nodes having the value 'New York' for the `bornIn` property, only a single 'New York' node (i.e. a `City` node with a name of 'New York') is created. As the 'New York' node is not matched for the first bound node, it is created. However, the newly-created 'New York' node is matched and bound for the second and third bound nodes.

Table 214. Result

<table>
<thead>
<tr>
<th>person.name</th>
<th>person.bornIn</th>
<th>city</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;Charlie Sheen&quot;</td>
<td>&quot;New York&quot;</td>
<td>Node[7]{name:&quot;New York&quot;}</td>
</tr>
<tr>
<td>&quot;Martin Sheen&quot;</td>
<td>&quot;Ohio&quot;</td>
<td>Node[8]{name:&quot;Ohio&quot;}</td>
</tr>
</tbody>
</table>
9.15.3. Use **ON CREATE** and **ON MATCH**

**Merge with ON CREATE**

Merge a node and set properties if the node needs to be created.

**Query**

```mermaid
MERGE (keanu:Person {name: 'Keanu Reeves'})
ON CREATE
  SET keanu.created = timestamp()
RETURN keanu.name, keanu.created
```

The query creates the 'keanu' node and sets a timestamp on creation time.

**Table 215. Result**

<table>
<thead>
<tr>
<th>keanu.name</th>
<th>keanu.created</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;Keanu Reeves&quot;</td>
<td>1660050080003</td>
</tr>
</tbody>
</table>

Rows: 1
Nodes created: 1
Properties set: 2
Labels added: 1

**Merge with ON MATCH**

Merging nodes and setting properties on found nodes.

**Query**

```mermaid
MERGE (person:Person)
ON MATCH
  SET person.found = true
RETURN person.name, person.found
```

The query finds all the **Person** nodes, sets a property on them, and returns them.

**Table 216. Result**

<table>
<thead>
<tr>
<th>person.name</th>
<th>person.found</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;Charlie Sheen&quot;</td>
<td>true</td>
</tr>
</tbody>
</table>
Merge with **ON CREATE** and **ON MATCH**

**Query**

```sql
MERGE (keanu:Person {name: 'Keanu Reeves'})
ON CREATE
  SET keanu.created = timestamp()
ON MATCH
  SET keanu.lastSeen = timestamp()
RETURN keanu.name, keanu.created, keanu.lastSeen
```

The query creates the 'keanu' node, and sets a timestamp on creation time. If 'keanu' had already existed, a different property would have been set.

**Table 217. Result**

<table>
<thead>
<tr>
<th>keanu.name</th>
<th>keanu.created</th>
<th>keanu.lastSeen</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;Keanu Reeves&quot;</td>
<td>1660050082742</td>
<td>&lt;null&gt;</td>
</tr>
</tbody>
</table>

Rows: 1  
Nodes created: 1  
Properties set: 2  
Labels added: 1

Merge with **ON MATCH** setting multiple properties

If multiple properties should be set, simply separate them with commas.

**Query**

```sql
MERGE (person:Person)
ON MATCH
  SET
    person.found = true,
    person.lastAccessed = timestamp()
RETURN person.name, person.found, person.lastAccessed
```

**Table 218. Result**

<table>
<thead>
<tr>
<th>person.name</th>
<th>person.found</th>
<th>person.lastAccessed</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;Charlie Sheen&quot;</td>
<td>true</td>
<td>1660050084020</td>
</tr>
<tr>
<td>&quot;Martin Sheen&quot;</td>
<td>true</td>
<td>1660050084020</td>
</tr>
<tr>
<td>&quot;Michael Douglas&quot;</td>
<td>true</td>
<td>1660050084020</td>
</tr>
</tbody>
</table>
### 9.15.4. Merge relationships

#### Merge on a relationship

**MERGE** can be used to match or create a relationship.

**Query**

```
MATCH (charlie:Person {name: 'Charlie Sheen'}),
    (wallStreet:Movie {title: 'Wall Street'})
MERGE (charlie)-[:ACTED_IN]->(wallStreet)
RETURN charlie.name, type(r), wallStreet.title
```

'Charlie Sheen' had already been marked as acting in 'Wall Street', so the existing relationship is found and returned. Note that in order to match or create a relationship when using **MERGE**, at least one bound node must be specified, which is done via the **MATCH** clause in the above example.

**Table 219. Result**

<table>
<thead>
<tr>
<th>charlie.name</th>
<th>type(r)</th>
<th>wallStreet.title</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;Charlie Sheen&quot;</td>
<td>&quot;ACTED_IN&quot;</td>
<td>&quot;Wall Street&quot;</td>
</tr>
</tbody>
</table>

**Rows: 1**

#### Merge on multiple relationships

**Query**

```
MATCH (oliver:Person {name: 'Oliver Stone'}),
    (reiner:Person {name: 'Rob Reiner'})
MERGE (oliver)-[:DIRECTED]->(movie:Movie)<-[:ACTED_IN]-(reiner)
RETURN movie
```

In our example graph, 'Oliver Stone' and 'Rob Reiner' have never worked together. When we try to **MERGE** a 'movie between them, Neo4j will not use any of the existing movies already connected to either person. Instead, a new 'movie' node is created.

**Table 220. Result**

<table>
<thead>
<tr>
<th>movie</th>
</tr>
</thead>
<tbody>
<tr>
<td>Node[7]{}</td>
</tr>
</tbody>
</table>
Merge on an undirected relationship

`MERGE` can also be used with an undirected relationship. When it needs to create a new one, it will pick a direction.

**Query**

```sql
MATCH
  (charlie:Person {name: 'Charlie Sheen'}),
  (oliver:Person {name: 'Oliver Stone'})
MERGE (charlie)-[r:KNOWS]->(oliver)
RETURN r
```

As 'Charlie Sheen' and 'Oliver Stone' do not know each other this `MERGE` query will create a `KNOWS` relationship between them. The direction of the created relationship is arbitrary.

**Table 221. Result**

<table>
<thead>
<tr>
<th>r</th>
<th>:KNOWS[8]{}</th>
</tr>
</thead>
<tbody>
<tr>
<td>Rows: 1</td>
<td>Relationships created: 1</td>
</tr>
</tbody>
</table>

Merge on a relationship between two existing nodes

`MERGE` can be used in conjunction with preceding `MATCH` and `MERGE` clauses to create a relationship between two bound nodes 'm' and 'n', where 'm' is returned by `MATCH` and 'n' is created or matched by the earlier `MERGE`.

**Query**

```sql
MATCH
  (person:Person)
MERGE (city:City {name: person.bornIn})
MERGE (person)-[r:BORN_IN]->(city)
RETURN person.name, person.bornIn, city
```

This builds on the example from Merge single node derived from an existing node property. The second `MERGE` creates a `BORN_IN` relationship between each person and a city corresponding to the value of the person's `bornIn` property. 'Charlie Sheen', 'Rob Reiner' and 'Oliver Stone' all have a `BORN_IN` relationship to the 'same' City node ('New York').

**Table 222. Result**

<table>
<thead>
<tr>
<th>person.name</th>
<th>person.bornIn</th>
<th>city</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;Charlie Sheen&quot;</td>
<td>&quot;New York&quot;</td>
<td>Node[7]{name:&quot;New York&quot;}</td>
</tr>
</tbody>
</table>
Merge on a relationship between an existing node and a merged node derived from a node property

`MERGE` can be used to simultaneously create both a new node 'n' and a relationship between a bound node 'm' and 'n'.

Query

```
MATCH (person:Person)
MERGE (person)-[r:HAS_CHAUFFEUR]->(chauffeur:Chauffeur {name: person.chauffeurName})
RETURN person.name, person.chauffeurName, chauffeur
```

As `MERGE` found no matches — in our example graph, there are no nodes labeled with Chauffeur and no `HAS_CHAUFFEUR` relationships — `MERGE` creates five nodes labeled with Chauffeur, each of which contains a name property whose value corresponds to each matched Person node's chauffeurName property value. `MERGE` also creates a `HAS_CHAUFFEUR` relationship between each Person node and the newly-created corresponding Chauffeur node. As 'Charlie Sheen' and 'Michael Douglas' both have a chauffeur with the same name — 'John Brown' — a new node is created in each case, resulting in 'two' Chauffeur nodes having a name of 'John Brown', correctly denoting the fact that even though the name property may be identical, these are two separate people. This is in contrast to the example shown above in Merge on a relationship between two existing nodes, where we used the first `MERGE` to bind the City nodes to prevent them from being recreated (and thus duplicated) in the second `MERGE`.

Table 223. Result

<table>
<thead>
<tr>
<th>person.name</th>
<th>person.chauffeurName</th>
<th>chauffeur</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;Charlie Sheen&quot;</td>
<td>&quot;John Brown&quot;</td>
<td>Node[7]{name:&quot;John Brown&quot;}</td>
</tr>
<tr>
<td>&quot;Martin Sheen&quot;</td>
<td>&quot;Bob Brown&quot;</td>
<td>Node[8]{name:&quot;Bob Brown&quot;}</td>
</tr>
<tr>
<td>&quot;Michael Douglas&quot;</td>
<td>&quot;John Brown&quot;</td>
<td>Node[9]{name:&quot;John Brown&quot;}</td>
</tr>
<tr>
<td>&quot;Oliver Stone&quot;</td>
<td>&quot;Bill White&quot;</td>
<td>Node[10]{name:&quot;Bill White&quot;}</td>
</tr>
<tr>
<td>&quot;Rob Reiner&quot;</td>
<td>&quot;Ted Green&quot;</td>
<td>Node[11]{name:&quot;Ted Green&quot;}</td>
</tr>
</tbody>
</table>

Rows: 5
Nodes created: 5
Relationships created: 5
Properties set: 5
Labels added: 5
9.15.5. Using unique constraints with **MERGE**

Cypher prevents getting conflicting results from **MERGE** when using patterns that involve unique constraints. In this case, there must be at most one node that matches that pattern.

For example, given two unique constraints on :Person(id) and :Person(ssn), a query such as **MERGE** (n:Person {id: 12, ssn: 437}) will fail, if there are two different nodes (one with id 12 and one with ssn 437) or if there is only one node with only one of the properties. In other words, there must be exactly one node that matches the pattern, or no matching nodes.

Note that the following examples assume the existence of unique constraints that have been created using:

```
CREATE CONSTRAINT ON (n:Person) ASSERT n.name IS UNIQUE;
CREATE CONSTRAINT ON (n:Person) ASSERT n.role IS UNIQUE;
```

**Merge using unique constraints creates a new node if no node is found**

Query

```
MERGE (laurence:Person {name: 'Laurence Fishburne'})
RETURN laurence.name
```

The query creates the 'laurence' node. If 'laurence' had already existed, **MERGE** would just match the existing node.

<table>
<thead>
<tr>
<th>Table 224. Result</th>
</tr>
</thead>
<tbody>
<tr>
<td>laurence.name</td>
</tr>
<tr>
<td>&quot;Laurence Fishburne&quot;</td>
</tr>
<tr>
<td>Rows: 1</td>
</tr>
<tr>
<td>Nodes created: 1</td>
</tr>
<tr>
<td>Properties set: 1</td>
</tr>
<tr>
<td>Labels added: 1</td>
</tr>
</tbody>
</table>

**Merge using unique constraints matches an existing node**

Query

```
MERGE (oliver:Person {name: 'Oliver Stone'})
RETURN oliver.name, oliver.bornIn
```

The 'oliver' node already exists, so **MERGE** just matches it.

| Table 225. Result | 168 |
Merge with unique constraints and partial matches

Merge using unique constraints fails when finding partial matches.

Query

```
MERGE (michael:Person {name: 'Michael Douglas', role: 'Gordon Gekko'})
#RETURN michael
```

While there is a matching unique 'michael' node with the name 'Michael Douglas', there is no unique node with the role of 'Gordon Gekko' and MERGE fails to match.

Error message

```
Merge did not find a matching node michael and can not create a new node due to conflicts with existing unique nodes
```

If we want to give Michael Douglas the role of Gordon Gekko, we can use the SET clause instead:

Query

```
MERGE (michael:Person {name: 'Michael Douglas'})
SET michael.role = 'Gordon Gekko'
```

Merge with unique constraints and conflicting matches

Merge using unique constraints fails when finding conflicting matches.

Query

```
MERGE (oliver:Person {name: 'Oliver Stone', role: 'Gordon Gekko'})
RETURN oliver
```

While there is a matching unique 'oliver' node with the name 'Oliver Stone', there is also another unique node with the role of 'Gordon Gekko' and MERGE fails to match.

Error message

```
Merge did not find a matching node oliver and can not create a new node due to conflicts with existing unique nodes
```

Using map parameters with MERGE

MERGE does not support map parameters the same way CREATE does. To use map parameters with MERGE, it is necessary to explicitly use the expected properties, such as in the following example. For more information on parameters, see Parameters.
Parameters

```
{
  "param" : {
    "name" : "Keanu Reeves",
    "role" : "Neo"
  }
}
```

Query

```
MERGE (person:Person {name: $param.name, role: $param.role})
RETURN person.name, person.role
```

Table 226. Result

<table>
<thead>
<tr>
<th>person.name</th>
<th>person.role</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;Keanu Reeves&quot;</td>
<td>&quot;Neo&quot;</td>
</tr>
</tbody>
</table>

9.16. CALL {} (subquery)

The CALL {} clause evaluates a subquery that returns some values.

- Introduction
- Importing variables into subqueries
- Post-union processing
- Aggregation and side-effects
- Aggregation on imported variables

9.16.1. Introduction

CALL allows to execute subqueries, i.e. queries inside of other queries. Subqueries allow you to compose queries, which is especially useful when working with UNION or aggregations.

The CALL clause is also used for calling procedures. For descriptions of the CALL clause in this context, refer to CALL procedure.

A subquery is evaluated for each incoming input row and may produce an arbitrary number of output rows. Every output row is then combined with the input row to build the result of the subquery. That means that a subquery will influence the number of rows. If the subquery does not return any rows, there will be no rows available after the subquery.

There are restrictions on what queries are allowed as subqueries and how they interact with the enclosing query:
- A subquery must end with a RETURN clause.
- A subquery can only refer to variables from the enclosing query if they are explicitly imported.
- A subquery cannot return variables with the same names as variables in the enclosing query.
- All variables that are returned from a subquery are afterwards available in the enclosing query.

The following graph is used for the examples below:

![Graph](image)

### 9.16.2. Importing variables into subqueries

Variables are imported into a subquery using an importing WITH clause. As the subquery is evaluated for each incoming input row, the imported variables get bound to the corresponding values from the input row in each evaluation.

#### Query

```sql
UNWIND [0, 1, 2] AS x
CALL {
    WITH x
    RETURN x * 10 AS y
} RETURN x, y
```

<table>
<thead>
<tr>
<th>x</th>
<th>y</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>0</td>
</tr>
<tr>
<td>1</td>
<td>10</td>
</tr>
<tr>
<td>2</td>
<td>20</td>
</tr>
</tbody>
</table>

#### Table 227. Result

An importing WITH clause must:

- Consist only of simple references to outside variables - e.g. WITH x, y, z. Aliasing or expressions are not supported in importing WITH clauses - e.g. WITH a AS b or WITH a+1 AS b.
- Be the first clause of a subquery (or the second clause, if directly following a USE clause).

### 9.16.3. Post-union processing

Subqueries can be used to process the results of a UNION query further. This example query finds the
youngest and the oldest person in the database and orders them by name.

Query

```sql
CALL {
    MATCH (p:Person)
    RETURN p
    ORDER BY p.age ASC
    LIMIT 1
    UNION
    MATCH (p:Person)
    RETURN p
    ORDER BY p.age DESC
    LIMIT 1
}
RETURN p.name, p.age
ORDER BY p.name
```

Table 228. Result

<table>
<thead>
<tr>
<th>p.name</th>
<th>p.age</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;Alice&quot;</td>
<td>20</td>
</tr>
<tr>
<td>&quot;Charlie&quot;</td>
<td>65</td>
</tr>
</tbody>
</table>

Rows: 2

If different parts of a result should be matched differently, with some aggregation over the whole results, subqueries need to be used. This example query finds friends and/or parents for each person. Subsequently the number of friends and parents are counted together.

Query

```sql
MATCH (p:Person)
CALL {
    WITH p
    OPTIONAL MATCH (p)-[:FRIEND_OF]-(other:Person)
    RETURN other
    UNION
    WITH p
    OPTIONAL MATCH (p)-[:CHILD_OF]-(other:Parent)
    RETURN other
}
RETURN DISTINCT p.name, count(other)
```

Table 229. Result

<table>
<thead>
<tr>
<th>p.name</th>
<th>count(other)</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;Alice&quot;</td>
<td>2</td>
</tr>
<tr>
<td>&quot;Bob&quot;</td>
<td>0</td>
</tr>
<tr>
<td>&quot;Charlie&quot;</td>
<td>0</td>
</tr>
<tr>
<td>&quot;Dora&quot;</td>
<td>0</td>
</tr>
</tbody>
</table>

Rows: 4

9.16.4. Aggregation and side-effects

Subqueries can be useful to do aggregations for each row and to isolate side-effects. This example query
creates five Clone nodes for each existing person. The aggregation ensures that cardinality is not changed by the subquery. Without this, the result would be five times as many rows.

Query

MATCH (p:Person)
CALL {
    UNWIND range(1, 5) AS i
    CREATE (c:Clone)
    RETURN count(c) AS numberOfClones
}
RETURN p.name, numberOfClones

Table 230. Result

<table>
<thead>
<tr>
<th>p.name</th>
<th>numberOfClones</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;Alice&quot;</td>
<td>5</td>
</tr>
<tr>
<td>&quot;Bob&quot;</td>
<td>5</td>
</tr>
<tr>
<td>&quot;Charlie&quot;</td>
<td>5</td>
</tr>
<tr>
<td>&quot;Dora&quot;</td>
<td>5</td>
</tr>
</tbody>
</table>

Rows: 4
Nodes created: 20
Labels added: 20

9.16.5. Aggregation on imported variables

Aggregations in subqueries are scoped to the subquery evaluation, also for imported variables. The following example counts the number of younger persons for each person in the graph:

Query

MATCH (p:Person)
CALL {
    WITH p
    MATCH (other:Person)
    WHERE other.age < p.age
    RETURN count(other) AS youngerPersonsCount
}
RETURN p.name, youngerPersonsCount

Table 231. Result

<table>
<thead>
<tr>
<th>p.name</th>
<th>youngerPersonsCount</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;Alice&quot;</td>
<td>0</td>
</tr>
<tr>
<td>&quot;Bob&quot;</td>
<td>1</td>
</tr>
<tr>
<td>&quot;Charlie&quot;</td>
<td>3</td>
</tr>
<tr>
<td>&quot;Dora&quot;</td>
<td>2</td>
</tr>
</tbody>
</table>

Rows: 4
9.17. CALL procedure

The CALL clause is used to call a procedure deployed in the database.

9.17.1. Introduction

Procedures are called using the CALL clause.

The CALL clause is also used to evaluate a subquery. For descriptions of the CALL clause in this context, refer to \texttt{CALL \{\}} (subquery).

Each procedure call needs to specify all required procedure arguments. This may be done either explicitly, by using a comma-separated list wrapped in parentheses after the procedure name, or implicitly by using available query parameters as procedure call arguments. The latter form is available only in a so-called standalone procedure call, when the whole query consists of a single CALL clause.

Most procedures return a stream of records with a fixed set of result fields, similar to how running a Cypher query returns a stream of records. The \texttt{YIELD} sub-clause is used to explicitly select which of the available result fields are returned as newly-bound variables from the procedure call to the user or for further processing by the remaining query. Thus, in order to be able to use \texttt{YIELD} for explicit columns, the names (and types) of the output parameters need be known in advance. Each yielded result field may optionally be renamed using aliasing (i.e., \texttt{resultFieldName AS newName}). All new variables bound by a procedure call are added to the set of variables already bound in the current scope. It is an error if a procedure call tries to rebind a previously bound variable (i.e., a procedure call cannot shadow a variable that was previously bound in the current scope). In a standalone procedure call, \texttt{YIELD \*} can be used to select all columns. In this case, the name of the output parameters does not need to be known in advance.

For more information on how to determine the input parameters for the \texttt{CALL} procedure and the output parameters for the \texttt{YIELD} procedure, see View the signature for a procedure.

Inside a larger query, the records returned from a procedure call with an explicit \texttt{YIELD} may be further filtered using a WHERE sub-clause followed by a predicate (similar to WITH ... WHERE ...).

If the called procedure declares at least one result field, \texttt{YIELD} may generally not be omitted. However \texttt{YIELD} may always be omitted in a standalone procedure call. In this case, all result fields are yielded as newly-bound variables from the procedure call to the user.

Neo4j supports the notion of VOID procedures. A VOID procedure is a procedure that does not declare any result fields and returns no result records and that has explicitly been declared as VOID. Calling a VOID procedure may only have a side effect and thus does neither allow nor require the use of \texttt{YIELD}. Calling a VOID procedure in the middle of a larger query will simply pass on each input record (i.e., it acts like WITH \* in terms of the record stream).
Neo4j comes with a number of built-in procedures. For a list of these, see Operations Manual → Procedures.

Users can also develop custom procedures and deploy to the database. See Java Reference → User-defined procedures for details.

9.17.2. Call a procedure using CALL

This calls the built-in procedure `db.labels`, which lists all labels used in the database.

Query

```cypher
CALL db.labels()
```

Table 232. Result

<table>
<thead>
<tr>
<th>label</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;User&quot;</td>
</tr>
<tr>
<td>&quot;Administrator&quot;</td>
</tr>
</tbody>
</table>

Rows: 2

Cypher allows the omission of parentheses on procedures of arity-0 (no arguments).

Best practice is to use parentheses for procedures.

Query

```cypher
CALL db.labels()
```

Table 233. Result

<table>
<thead>
<tr>
<th>label</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;User&quot;</td>
</tr>
<tr>
<td>&quot;Administrator&quot;</td>
</tr>
</tbody>
</table>

Rows: 2

9.17.3. View the signature for a procedure

To CALL a procedure, its input parameters need to be known, and to use YIELD, its output parameters need to be known. The built-in procedure `dbms.procedures` returns the name, signature and description for all procedures. The following query can be used to return the signature for a particular procedure:

Query

```cypher
CALL dbms.procedures() YIELD name, signature
WHERE name='dbms.listConfig'
RETURN signature
```
We can see that the `dbms.listConfig` has one input parameter, `searchString`, and three output parameters, `name`, `description` and `value`.

Table 234. Result

<table>
<thead>
<tr>
<th>signature</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;dbms.listConfig(searchString = :: STRING?) :: (name :: STRING?, description :: STRING?, value :: STRING?, dynamic :: BOOLEAN?)&quot;</td>
</tr>
<tr>
<td>Rows: 1</td>
</tr>
</tbody>
</table>

9.17.4. Call a procedure using a quoted namespace and name

This calls the built-in procedure `db.labels`, which lists all labels used in the database.

Query

```
CALL `db`.labels()
```

Query

```
CALL `db`.labels
```

9.17.5. Call a procedure with literal arguments

This calls the example procedure `dbms.security.createUser` using literal arguments. The arguments are written out directly in the statement text.

Query

```
CALL dbms.security.createUser('example_username', 'example_password', false)
```

Since our example procedure does not return any result, the result is empty.

9.17.6. Call a procedure with parameter arguments

This calls the example procedure `dbms.security.createUser` using parameters as arguments. Each procedure argument is taken to be the value of a corresponding statement parameter with the same name (or null if no such parameter has been given).

```
Examples that use parameter arguments shows the given parameters in JSON format; the exact manner in which they are to be submitted depends upon the driver being used. See Parameters, for more about querying with parameters
```

```
Parameters

{
    "username" : "example_username",
    "password" : "example_password",
    "requirePasswordChange" : false
}
```
Query

CALL dbms.security.createUser($username, $password, $requirePasswordChange)

Since our example procedure does not return any result, the result is empty.

Cypher allows the omission of parentheses for procedures with arity-\(n\) (\(n\) arguments), Cypher implicitly passes the parameter arguments.

Best practice is to use parentheses for procedures. Omission of parentheses is available only in a so-called standalone procedure call, when the whole query consists of a single CALL clause.

Parameters

{
  "username" : "example_username",
  "password" : "example_password",
  "requirePasswordChange" : false
}

Query

CALL dbms.security.createUser

Since our example procedure does not return any result, the result is empty.

9.17.7. Call a procedure with mixed literal and parameter arguments

This calls the example procedure \texttt{dbms.security.createUser} using both literal and parameter arguments.

Parameters

{
  "password" : "example_password"
}

Query

CALL dbms.security.createUser('example_username', $password, false)

Since our example procedure does not return any result, the result is empty.

9.17.8. Call a procedure with literal and default arguments

This calls the example procedure \texttt{dbms.security.createUser} using literal arguments. That is, arguments that are written out directly in the statement text, and a trailing default argument that is provided by the procedure itself.
Since our example procedure does not return any result, the result is empty.

9.17.9. Call a procedure using \texttt{CALL YIELD *}

This calls the built-in procedure \texttt{db.labels} to count all labels used in the database.

\begin{verbatim}
CALL db.labels() YIELD *
\end{verbatim}

If the procedure has deprecated return columns, those columns are also returned.

9.17.10. Call a procedure within a complex query using \texttt{CALL YIELD}

This calls the built-in procedure \texttt{db.labels} to count all labels used in the database.

\begin{verbatim}
CALL db.labels() YIELD label
RETURN count(label) AS numLabels
\end{verbatim}

Since the procedure call is part of a larger query, all outputs must be named explicitly.

9.17.11. Call a procedure and filter its results

This calls the built-in procedure \texttt{db.labels} to count all in-use labels in the database that contain the word 'User'.

\begin{verbatim}
CALL db.labels() YIELD label
WHERE label CONTAINS 'User'
RETURN count(label) AS numLabels
\end{verbatim}

Since the procedure call is part of a larger query, all outputs must be named explicitly.

9.17.12. Call a procedure within a complex query and rename its outputs

This calls the built-in procedure \texttt{db.propertyKeys} as part of counting the number of nodes per property key that is currently used in the database.
Since the procedure call is part of a larger query, all outputs must be named explicitly.

### 9.18. UNION

*The UNION clause is used to combine the result of multiple queries.*

- **Introduction**
- **Combine two queries and retain duplicates**
- **Combine two queries and remove duplicates**

#### 9.18.1. Introduction

**UNION** combines the results of two or more queries into a single result set that includes all the rows that belong to all queries in the union.

The number and the names of the columns must be identical in all queries combined by using **UNION**.

To keep all the result rows, use **UNION ALL**. Using just **UNION** will combine and remove duplicates from the result set.

#### 9.18.2. Combine two queries and retain duplicates

Combining the results from two queries is done using **UNION ALL**.

**Graph**

```sql
CALL db.propertyKeys() YIELD propertyKey AS prop
MATCH (n)
WHERE n[prop] IS NOT NULL
RETURN prop, count(n) AS numNodes
```
The combined result is returned, including duplicates.

Table 235. Result

<table>
<thead>
<tr>
<th>name</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;Anthony Hopkins&quot;</td>
</tr>
<tr>
<td>&quot;Helen Mirren&quot;</td>
</tr>
<tr>
<td>&quot;Hitchcock&quot;</td>
</tr>
<tr>
<td>&quot;Hitchcock&quot;</td>
</tr>
</tbody>
</table>

Rows: 4

9.18.3. Combine two queries and remove duplicates

By not including ALL in the UNION, duplicates are removed from the combined result set

The combined result is returned, without duplicates.

Table 236. Result

<table>
<thead>
<tr>
<th>name</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;Anthony Hopkins&quot;</td>
</tr>
<tr>
<td>&quot;Helen Mirren&quot;</td>
</tr>
<tr>
<td>&quot;Hitchcock&quot;</td>
</tr>
</tbody>
</table>

Rows: 3

9.19. USE

The USE clause determines which graph a query, or query part, is executed against.

- Introduction
- Syntax
- Examples
9.19.1. Introduction

The `USE` clause determines which graph a query, or query part, is executed against. It is supported for queries and schema commands.

- Query remote graph by name
- Query remote graph by graph ID

The `USE` clause can not be used together with the `PERIODIC COMMIT` clause.

9.19.2. Syntax

The `USE` clause can only appear as the prefix of schema commands, or as the first clause of queries:

```
USE <graph>
<other clauses>
```

Where `<graph>` refers to the name of a database in the DBMS.

Fabric syntax

When running queries against a Fabric database, the `USE` clause can also appear as the first clause of:

- Union parts:

  ```
  USE <graph>
  <other clauses>
  UNION
  USE <graph>
  <other clauses>
  ```

- Subqueries:

  ```
  CALL {
  USE <graph>
  <other clauses>
  }
  ```

  In subqueries, a `USE` clause may appear as the second clause, if directly following an `importing WITH` clause

When executing queries against a Fabric database, in addition to referring to databases in the DBMS, the `<graph>` may also refer to a graph mounted through the Fabric configuration. For more information, see Operations Manual → Fabric.

9.19.3. Examples
Query a graph by name

In this example we assume that your DBMS contains a database named `myDatabase`:

Query.

```
USE myDatabase
MATCH (n) RETURN n
```

Query a Fabric graph by name

In this example we assume that we have configured a Fabric database called `exampleFabricSetup`. The graph that we wish to query is named `exampleDatabaseName`:

Query.

```
USE exampleFabricSetup.exampleDatabaseName
MATCH (n) RETURN n
```

Query a Fabric graph by graph ID

This example continues with a Fabric database called `exampleFabricSetup`.

The graph we wish to query is configured with the graph id 0, which is why we can refer to it using the built-in function `graph()` with the argument 0:

Query.

```
USE exampleFabricSetup.graph(0)
MATCH (n) RETURN n
```

9.20. LOAD CSV

LOAD CSV is used to import data from CSV files.

- Introduction
- CSV file format
- Import data from a CSV file
- Import data from a remote CSV file
- Import data from a CSV file containing headers
- Import data from a CSV file with a custom field delimiter
- Importing large amounts of data
- Setting the rate of periodic commits
- Import data containing escaped characters
- Using linenumber() with LOAD CSV
Using file() with LOAD CSV

9.20.1. Introduction

- The URL of the CSV file is specified by using `FROM` followed by an arbitrary expression evaluating to the URL in question.
- It is required to specify a variable for the CSV data using `AS`.
- CSV files can be stored on the database server and are then accessible using a `file:///` URL. Alternatively, `LOAD CSV` also supports accessing CSV files via HTTPS, HTTP, and FTP.
- `LOAD CSV` supports resources compressed with gzip and Deflate. Additionally, `LOAD CSV` supports locally stored CSV files compressed with ZIP.
- `LOAD CSV` will follow HTTP redirects but for security reasons it will not follow redirects that changes the protocol, for example if the redirect is going from HTTPS to HTTP.
- `LOAD CSV` is often used in conjunction with the query hint `PERIODIC COMMIT`; more information on this may be found in `PERIODIC COMMIT` query hint.

Configuration settings for file URLs

`dbms.security.allow_csv_import_from_file_urls`

This setting determines if Cypher will allow the use of `file:///` URLs when loading data using `LOAD CSV`. Such URLs identify files on the filesystem of the database server. Default is true. Setting `dbms.security.allow_csv_import_from_file_urls=false` will completely disable access to the file system for `LOAD CSV`.

`dbms.directories.import`

Sets the root directory for `file:///` URLs used with the Cypher `LOAD CSV` clause. This should be set to a single directory relative to the Neo4j installation path on the database server. All requests to load from `file:///` URLs will then be relative to the specified directory. The default value set in the config settings is `import`. This is a security measure which prevents the database from accessing files outside the standard import directory, similar to how a Unix `chroot` operates. Setting this to an empty field will allow access to all files within the Neo4j installation folder. Commenting out this setting will disable the security feature, allowing all files in the local system to be imported. This is definitely not recommended.

File URLs will be resolved relative to the `dbms.directories.import` directory. For example, a file URL will typically look like `file:///myfile.csv` or `file:///myproject/myfile.csv`.

- When using `file:///` URLs, spaces and other non-alphanumeric characters need to be URL encoded.  
- If `dbms.directories.import` is set to the default value `import`, using the above URLs in `LOAD CSV` would read from `<NEO4J_HOME>/import/myfile.csv` and `<NEO4J_HOME>/import/myproject/myfile.csv` respectively.
- If it is set to `/data/csv`, using the above URLs in `LOAD CSV` would read from `<NEO4J_HOME>/data/csv/myfile.csv` and `<NEO4J_HOME>/data/csv/myproject/myfile.csv` respectively.

The file location is relative to the import. The config setting `dbms.directories.import` only applies to local disc and not to remote URLs.
See the examples below for further details.

9.20.2. CSV file format

The CSV file to use with \texttt{LOAD CSV} must have the following characteristics:

- the character encoding is UTF-8;
- the end line termination is system dependent, e.g., it is \texttt{\n} on unix or \texttt{\r\n} on windows;
- the default field terminator is \texttt{,};
- the field terminator character can be change by using the option \texttt{FIELDTERMINATOR} available in the \texttt{LOAD CSV} command;
- quoted strings are allowed in the CSV file and the quotes are dropped when reading the data;
- the character for string quotation is double quote \texttt{"};
- if \texttt{dbms.import.csv.legacy_quote_escaping} is set to the default value of \texttt{true}, \texttt{\} is used as an escape character;
- a double quote must be in a quoted string and escaped, either with the escape character or a second double quote.

9.20.3. Import data from a CSV file

To import data from a CSV file into Neo4j, you can use \texttt{LOAD CSV} to get the data into your query. Then you write it to your database using the normal updating clauses of Cypher.

\begin{verbatim}
artists.csv
1,ABBA,1992
2,Roxette,1986
3,Europe,1979
4,The Cardigans,1992
\end{verbatim}

\textbf{Query}

\begin{verbatim}
LOAD CSV FROM 'file:///artists.csv' AS line
CREATE (:Artist {name: line[1], year: toInteger(line[2])})
\end{verbatim}

A new node with the \texttt{Artist} label is created for each row in the CSV file. In addition, two columns from the CSV file are set as properties on the nodes.

\textbf{Result}

\begin{verbatim}
+-------------------+
| No data returned. |
+-------------------+
Nodes created: 4
Properties set: 8
Labels added: 4
\end{verbatim}
9.20.4. Import data from a remote CSV file

Accordingly, you can import data from a CSV file in a remote location into Neo4j. Note that this applies to all variations of CSV files (see examples below for other variations).

data.neo4j.com/bands/artists.csv

<table>
<thead>
<tr>
<th>Id</th>
<th>Name</th>
<th>Year</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>ABBA</td>
<td>1992</td>
</tr>
<tr>
<td>2</td>
<td>Roxette</td>
<td>1986</td>
</tr>
<tr>
<td>3</td>
<td>Europe</td>
<td>1979</td>
</tr>
<tr>
<td>4</td>
<td>The Cardigans</td>
<td>1992</td>
</tr>
</tbody>
</table>

Query

```
LOAD CSV FROM 'https://data.neo4j.com/bands/artists.csv' AS line
CREATE (:Artist {name: line[1], year: toInteger(line[2])})
```

Result

```
<table>
<thead>
<tr>
<th>No data returned.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Nodes created: 4</td>
</tr>
<tr>
<td>Properties set: 8</td>
</tr>
<tr>
<td>Labels added: 4</td>
</tr>
</tbody>
</table>
```

9.20.5. Import data from a CSV file containing headers

When your CSV file has headers, you can view each row in the file as a map instead of as an array of strings.

artists-with-headers.csv

<table>
<thead>
<tr>
<th>Id</th>
<th>Name</th>
<th>Year</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>ABBA</td>
<td>1992</td>
</tr>
<tr>
<td>2</td>
<td>Roxette</td>
<td>1986</td>
</tr>
<tr>
<td>3</td>
<td>Europe</td>
<td>1979</td>
</tr>
<tr>
<td>4</td>
<td>The Cardigans</td>
<td>1992</td>
</tr>
</tbody>
</table>

Query

```
LOAD CSV WITH HEADERS FROM 'file:///artists-with-headers.csv' AS line
CREATE (:Artist {name: line.Name, year: toInteger(line.Year)})
```

This time, the file starts with a single row containing column names. Indicate this using `WITH HEADERS` and you can access specific fields by their corresponding column name.

Result

```
<table>
<thead>
<tr>
<th>No data returned.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Nodes created: 4</td>
</tr>
<tr>
<td>Properties set: 8</td>
</tr>
<tr>
<td>Labels added: 4</td>
</tr>
</tbody>
</table>
```
9.20.6. Import data from a CSV file with a custom field delimiter

Sometimes, your CSV file has other field delimiters than commas. You can specify which delimiter your file uses, using FIELDTERMINATOR. Hexadecimal representation of the unicode character encoding can be used if prepended by \u. The encoding must be written with four digits. For example, \u003B is equivalent to ; (SEMICOLON).

artists-fieldterminator.csv

1;ABBA;1992
2;Roxette;1986
3;Europe;1979
4;The Cardigans;1992

Query

```
LOAD CSV FROM 'file:///artists-fieldterminator.csv' AS line FIELDTERMINATOR ';
CREATE (:Artist {name: line[1], year: toInteger(line[2])})
```

As values in this file are separated by a semicolon, a custom FIELDTERMINATOR is specified in the LOAD CSV clause.

Result

```
+-------------------+
| No data returned. |
+-------------------+
Nodes created: 4
Properties set: 8
Labels added: 4
```

9.20.7. Importing large amounts of data

If the CSV file contains a significant number of rows (approaching hundreds of thousands or millions), USING PERIODIC COMMIT can be used to instruct Neo4j to perform a commit after a number of rows. This reduces the memory overhead of the transaction state. By default, the commit will happen every 1000 rows. For more information, see PERIODIC COMMIT query hint.

Note: The USE clause cannot be used together with the PERIODIC COMMIT clause.

Query

```
USING PERIODIC COMMIT LOAD CSV FROM 'file:///artists.csv' AS line
CREATE (:Artist {name: line[1], year: toInteger(line[2])})
```

Result

```
+-------------------+
| No data returned. |
+-------------------+
Nodes created: 4
Properties set: 8
Labels added: 4
```
9.20.8. Setting the rate of periodic commits

You can set the number of rows as in the example, where it is set to 500 rows.

Query

```
USING PERIODIC COMMIT 500 LOAD CSV FROM 'file:///artists.csv' AS line
CREATE (:Artist {name: line[1], year: toInteger(line[2])})
```

Result

```
+-------------------+
| No data returned. |
+-------------------+
Nodes created: 4
Properties set: 8
Labels added: 4
```

9.20.9. Import data containing escaped characters

In this example, we both have additional quotes around the values, as well as escaped quotes inside one value.

`artists-with-escaped-char.csv`

```
"1","The "Symbol"","1992"
```

Query

```
LOAD CSV FROM 'file:///artists-with-escaped-char.csv' AS line
CREATE (a:Artist {name: line[1], year: toInteger(line[2])})
RETURN a.name AS name, a.year AS year, size(a.name) AS size
```

Note that strings are wrapped in quotes in the output here. You can see that when comparing to the length of the string in this case!

Result

```
+-------------------------------+
<table>
<thead>
<tr>
<th>name</th>
<th>year</th>
<th>size</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;The &quot;Symbol&quot;&quot;</td>
<td>1992</td>
<td>12</td>
</tr>
</tbody>
</table>
+-------------------------------+
1 row
Nodes created: 1
Properties set: 2
Labels added: 1
```

9.20.10. Using linenumber() with LOAD CSV

For certain scenarios, like debugging a problem with a csv file, it may be useful to get the current line number that LOAD CSV is operating on. The linenumber() function provides exactly that or null if called without a LOAD CSV context.
9.20.11. Using file() with LOAD CSV

For certain scenarios, like debugging a problem with a csv file, it may be useful to get the absolute path of the file that LOAD CSV is operating on. The file() function provides exactly that or null if called without a LOAD CSV context.
9.21. SHOW FUNCTIONS

This section explains the `SHOW FUNCTIONS` command.

Listing the available functions can be done with `SHOW FUNCTIONS`.

The command `SHOW FUNCTIONS` only outputs the default output; for a full output use the optional `YIELD` command. Full output: `SHOW FUNCTIONS YIELD *`.

This command will produce a table with the following columns:

**Table 237. List functions output**

<table>
<thead>
<tr>
<th>Column</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>The name of the function.</td>
</tr>
<tr>
<td>category</td>
<td>The function category, for example <code>scalar</code> or <code>string</code>.</td>
</tr>
<tr>
<td>description</td>
<td>The function description.</td>
</tr>
<tr>
<td>signature</td>
<td>The signature of the function.</td>
</tr>
<tr>
<td>isBuiltIn</td>
<td>Whether the function is built-in or user-defined.</td>
</tr>
<tr>
<td>argumentDescription</td>
<td>List of the arguments for the function, as map of strings with name, type, default, and description.</td>
</tr>
<tr>
<td>returnDescription</td>
<td>The return value type.</td>
</tr>
<tr>
<td>aggregating</td>
<td>Whether the function is aggregating or not.</td>
</tr>
<tr>
<td>rolesExecution</td>
<td>List of roles permitted to execute this function. Is null without the <code>SHOW ROLE</code> privilege.</td>
</tr>
<tr>
<td>rolesBoostedExecution</td>
<td>List of roles permitted to use boosted mode when executing this function. Is null without the <code>SHOW ROLE</code> privilege.</td>
</tr>
</tbody>
</table>

9.21.1. Syntax

List functions, either all or only built-in or user-defined
9.21.2. Listing all functions

To list all available functions with the default output columns, the `SHOW FUNCTIONS` command can be used. If all columns are required, use `SHOW FUNCTIONS YIELD *`.

<table>
<thead>
<tr>
<th>name</th>
<th>category</th>
<th>description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;abs&quot;</td>
<td>&quot;Numeric&quot;</td>
<td>&quot;Returns the absolute value of an integer.&quot;</td>
</tr>
<tr>
<td>&quot;abs&quot;</td>
<td>&quot;Numeric&quot;</td>
<td>&quot;Returns the absolute value of a floating point number.&quot;</td>
</tr>
<tr>
<td>&quot;acos&quot;</td>
<td>&quot;Trigonometric&quot;</td>
<td>&quot;Returns the arccosine of a number in radians.&quot;</td>
</tr>
<tr>
<td>&quot;all&quot;</td>
<td>&quot;Predicate&quot;</td>
<td>&quot;Returns true if the predicate holds for all elements in the given list.&quot;</td>
</tr>
<tr>
<td>&quot;any&quot;</td>
<td>&quot;Predicate&quot;</td>
<td>&quot;Returns true if the predicate holds for at least one element in the given list.&quot;</td>
</tr>
<tr>
<td>&quot;asin&quot;</td>
<td>&quot;Trigonometric&quot;</td>
<td>&quot;Returns the arcsine of a number in radians.&quot;</td>
</tr>
<tr>
<td>name</td>
<td>category</td>
<td>description</td>
</tr>
<tr>
<td>------</td>
<td>---------------</td>
<td>-----------------------------------------------------------------------------</td>

<tr>
<td>date.realtime</td>
<td>Temporal</td>
<td>&quot;Get the current Date instant using the realtime clock.&quot;</td>
</tr>
<tr>
<td>date.statement</td>
<td>Temporal</td>
<td>&quot;Get the current Date instant using the statement clock.&quot;</td>
</tr>
</tbody>
</table>

9.21.3. Listing functions with filtering on output columns

The listed functions can be filtered in multiple ways. One way is through the type keywords, **BUILT IN** and **USER DEFINED**. A more flexible way is to use the **WHERE** clause. For example, getting the name of all built-in functions starting with the letter ‘a’:

**Query**

```sql
SHOW BUILT IN FUNCTIONS YIELD name, isBuiltIn
WHERE name STARTS WITH 'a'
```

**Table 239. Result**

<table>
<thead>
<tr>
<th>name</th>
<th>isBuiltIn</th>
</tr>
</thead>
<tbody>
<tr>
<td>abs</td>
<td>true</td>
</tr>
<tr>
<td>abs</td>
<td>true</td>
</tr>
<tr>
<td>acos</td>
<td>true</td>
</tr>
<tr>
<td>all</td>
<td>true</td>
</tr>
</tbody>
</table>
### 9.21.4. Listing functions with other filtering

The listed functions can also be filtered on whether a user can execute them. This filtering is only available through the `EXECUTABLE` clause and not through the `WHERE` clause. This is due to using the user’s privileges instead of filtering on the available output columns.

There are two options, how to use the `EXECUTABLE` clause. The first option, is to filter for the current user:

**Query**

```
SHOW FUNCTIONS EXECUTABLE BY CURRENT USER YIELD *
```

#### Table 240. Result

<table>
<thead>
<tr>
<th>name</th>
<th>category</th>
<th>description</th>
<th>rolesExecution</th>
<th>rolesBoostedExecution</th>
<th>...</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;abs&quot;</td>
<td>&quot;Numeric&quot;</td>
<td>&quot;Returns the absolute value of an integer.&quot;</td>
<td>&lt;null&gt;</td>
<td>&lt;null&gt;</td>
<td></td>
</tr>
<tr>
<td>&quot;abs&quot;</td>
<td>&quot;Numeric&quot;</td>
<td>&quot;Returns the absolute value of a floating point number.&quot;</td>
<td>&lt;null&gt;</td>
<td>&lt;null&gt;</td>
<td></td>
</tr>
<tr>
<td>&quot;acos&quot;</td>
<td>&quot;Trigonometric&quot;</td>
<td>&quot;Returns the arccosine of a number in radians.&quot;</td>
<td>&lt;null&gt;</td>
<td>&lt;null&gt;</td>
<td></td>
</tr>
<tr>
<td>&quot;all&quot;</td>
<td>&quot;Predicate&quot;</td>
<td>&quot;Returns true if the predicate holds for all elements in the given list.&quot;</td>
<td>&lt;null&gt;</td>
<td>&lt;null&gt;</td>
<td></td>
</tr>
<tr>
<td>&quot;any&quot;</td>
<td>&quot;Predicate&quot;</td>
<td>&quot;Returns true if the predicate holds for at least one element in the given list.&quot;</td>
<td>&lt;null&gt;</td>
<td>&lt;null&gt;</td>
<td></td>
</tr>
<tr>
<td>name</td>
<td>category</td>
<td>description</td>
<td>rolesExecution</td>
<td>rolesBoostedExecution</td>
<td></td>
</tr>
<tr>
<td>--------</td>
<td>----------------</td>
<td>--------------------------------------------------</td>
<td>----------------</td>
<td>-----------------------</td>
<td></td>
</tr>
<tr>
<td>&quot;asin&quot;</td>
<td>&quot;Trigonometric&quot;</td>
<td>&quot;Returns the arcsine of a number in radians.&quot;</td>
<td>&lt;null&gt;</td>
<td>&lt;null&gt;</td>
<td></td>
</tr>
<tr>
<td>&quot;atan&quot;</td>
<td>&quot;Trigonometric&quot;</td>
<td>&quot;Returns the arctangent of a number in radians.&quot;</td>
<td>&lt;null&gt;</td>
<td>&lt;null&gt;</td>
<td></td>
</tr>
<tr>
<td>&quot;atan2&quot;</td>
<td>&quot;Trigonometric&quot;</td>
<td>&quot;Returns the arctangent2 of a set of coordinates in radians.&quot;</td>
<td>&lt;null&gt;</td>
<td>&lt;null&gt;</td>
<td></td>
</tr>
<tr>
<td>&quot;avg&quot;</td>
<td>&quot;Aggregating&quot;</td>
<td>&quot;Returns the average of a set of integer values.&quot;</td>
<td>&lt;null&gt;</td>
<td>&lt;null&gt;</td>
<td></td>
</tr>
<tr>
<td>&quot;avg&quot;</td>
<td>&quot;Aggregating&quot;</td>
<td>&quot;Returns the average of a set of floating point values.&quot;</td>
<td>&lt;null&gt;</td>
<td>&lt;null&gt;</td>
<td></td>
</tr>
</tbody>
</table>

Rows: 10

Notice that the two roles columns are empty due to missing the SHOW ROLE privilege.

The second option, is to filter for a specific user:

Query

```
SHOW FUNCTIONS EXECUTABLE BY jake
```

Table 241. Result

<table>
<thead>
<tr>
<th>name</th>
<th>category</th>
<th>description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;abs&quot;</td>
<td>&quot;Numeric&quot;</td>
<td>&quot;Returns the absolute value of an integer.&quot;</td>
</tr>
<tr>
<td>&quot;abs&quot;</td>
<td>&quot;Numeric&quot;</td>
<td>&quot;Returns the absolute value of a floating point number.&quot;</td>
</tr>
<tr>
<td>&quot;acos&quot;</td>
<td>&quot;Trigonometric&quot;</td>
<td>&quot;Returns the arccosine of a number in radians.&quot;</td>
</tr>
<tr>
<td>&quot;all&quot;</td>
<td>&quot;Predicate&quot;</td>
<td>&quot;Returns true if the predicate holds for all elements in the given list.&quot;</td>
</tr>
<tr>
<td>&quot;any&quot;</td>
<td>&quot;Predicate&quot;</td>
<td>&quot;Returns true if the predicate holds for at least one element in the given list.&quot;</td>
</tr>
<tr>
<td>&quot;asin&quot;</td>
<td>&quot;Trigonometric&quot;</td>
<td>&quot;Returns the arcsine of a number in radians.&quot;</td>
</tr>
<tr>
<td>&quot;atan&quot;</td>
<td>&quot;Trigonometric&quot;</td>
<td>&quot;Returns the arctangent of a number in radians.&quot;</td>
</tr>
<tr>
<td>&quot;atan2&quot;</td>
<td>&quot;Trigonometric&quot;</td>
<td>&quot;Returns the arctangent2 of a set of coordinates in radians.&quot;</td>
</tr>
</tbody>
</table>
### 9.22. SHOW PROCEDURES

This section explains the `SHOW PROCEDURES` command.

Listing the available procedures can be done with `SHOW PROCEDURES`.

The command `SHOW PROCEDURES` only outputs the default output; for a full output use the optional `YIELD` command. Full output: `SHOW PROCEDURES YIELD *`.

This command will produce a table with the following columns:

<table>
<thead>
<tr>
<th>Column</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>The name of the procedure.</td>
</tr>
<tr>
<td>description</td>
<td>The procedure description.</td>
</tr>
<tr>
<td>mode</td>
<td>The procedure mode, for example <code>READ</code> or <code>WRITE</code>.</td>
</tr>
<tr>
<td>worksOnSystem</td>
<td>Whether the procedure can be run on the <code>system</code> database or not.</td>
</tr>
<tr>
<td>signature</td>
<td>The signature of the procedure.</td>
</tr>
<tr>
<td>argumentDescription</td>
<td>List of the arguments for the procedure, as map of strings with name, type, default, and description.</td>
</tr>
<tr>
<td>returnDescription</td>
<td>List of the returned values for the procedure, as map of strings with name, type, and description.</td>
</tr>
<tr>
<td>admin</td>
<td><code>true</code> if this procedure is an admin procedure.</td>
</tr>
<tr>
<td>Column</td>
<td>Description</td>
</tr>
<tr>
<td>---------------------</td>
<td>--------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>rolesExecution</td>
<td>List of roles permitted to execute this procedure. Is null without the SHOW ROLE privilege.</td>
</tr>
<tr>
<td>rolesBoostedExecution</td>
<td>List of roles permitted to use boosted mode when executing this procedure. Is null without the SHOW ROLE privilege.</td>
</tr>
<tr>
<td>option</td>
<td>Map of extra output, e.g. if the procedure is deprecated.</td>
</tr>
</tbody>
</table>

### 9.22.1. Syntax

**List all procedures**

```sql
SHOW PROCEDURE[S] YIELD { * | field, ... } [ORDER BY field[, ...]] [SKIP n] [LIMIT n]
[WHERE expression]
[RETURN field[, ...] [ORDER BY field[, ...]] [SKIP n] [LIMIT n]]
```

> When using the RETURN clause, the YIELD clause is mandatory and may not be omitted.

**List procedures that the current user can execute**

```sql
SHOW PROCEDURE[S] EXECUTABLE [BY CURRENT USER] YIELD { * | field, ... } [ORDER BY field[, ...]] [SKIP n] [LIMIT n]
[WHERE expression]
[RETURN field[, ...] [ORDER BY field[, ...]] [SKIP n] [LIMIT n]]
```

> When using the RETURN clause, the YIELD clause is mandatory and may not be omitted.

**List procedures that the specified user can execute**

```sql
SHOW PROCEDURE[S] EXECUTABLE BY username YIELD { * | field, ... } [ORDER BY field[, ...]] [SKIP n] [LIMIT n]
[WHERE expression]
[RETURN field[, ...] [ORDER BY field[, ...]] [SKIP n] [LIMIT n]]
```

Requires the privilege SHOW USER. This command cannot be used for LDAP users.

> When using the RETURN clause, the YIELD clause is mandatory and may not be omitted.

### 9.22.2. Listing all procedures

To list all available procedures with the default output columns, the `SHOW PROCEDURES` command can be used. If all columns are required, use `SHOW PROCEDURES YIELD *`.

**Query**

```sql
SHOW PROCEDURES
```
<table>
<thead>
<tr>
<th>name</th>
<th>description</th>
<th>mode</th>
<th>worksOnSystem</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;db.awaitIndex&quot;</td>
<td>&quot;Wait for an index to come online (for example: CALL db.awaitIndex(&quot;MyIndex&quot;, 300)).&quot;</td>
<td>&quot;READ&quot;</td>
<td>true</td>
</tr>
<tr>
<td>&quot;db.awaitIndexes&quot;</td>
<td>&quot;Wait for all indexes to come online (for example: CALL db.awaitIndexes(300)).&quot;</td>
<td>&quot;READ&quot;</td>
<td>true</td>
</tr>
<tr>
<td>&quot;db.checkpoint&quot;</td>
<td>&quot;Initiate and wait for a new check point, or wait any already on-going check point to complete. Note that this temporarily disables the 'dbms.checkpoint.iops.limit' setting in order to make the check point complete faster. This might cause transaction throughput to degrade slightly, due to increased IO load.&quot;</td>
<td>&quot;DBMS&quot;</td>
<td>true</td>
</tr>
<tr>
<td>&quot;db.clearQueryCaches&quot;</td>
<td>&quot;Clears all query caches.&quot;</td>
<td>&quot;DBMS&quot;</td>
<td>true</td>
</tr>
<tr>
<td>&quot;db.constraints&quot;</td>
<td>&quot;List all constraints in the database.&quot;</td>
<td>&quot;READ&quot;</td>
<td>true</td>
</tr>
<tr>
<td>&quot;db.createIndex&quot;</td>
<td>&quot;Create a named schema index with specified index provider and configuration (optional). Yield: name, labels, properties, providerName, status&quot;</td>
<td>&quot;SCHEMA&quot;</td>
<td>false</td>
</tr>
<tr>
<td>&quot;db.createLabel&quot;</td>
<td>&quot;Create a label&quot;</td>
<td>&quot;WRITE&quot;</td>
<td>false</td>
</tr>
<tr>
<td>&quot;db.createNodeKey&quot;</td>
<td>&quot;Create a named node key constraint. Backing index will use specified index provider and configuration (optional). Yield: name, labels, properties, providerName, status&quot;</td>
<td>&quot;SCHEMA&quot;</td>
<td>false</td>
</tr>
<tr>
<td>&quot;db.createProperty&quot;</td>
<td>&quot;Create a Property&quot;</td>
<td>&quot;WRITE&quot;</td>
<td>false</td>
</tr>
<tr>
<td>&quot;db.createRelationshipType&quot;</td>
<td>&quot;Create a RelationshipType&quot;</td>
<td>&quot;WRITE&quot;</td>
<td>false</td>
</tr>
<tr>
<td>&quot;db.createUniquePropertyConstraint&quot;</td>
<td>&quot;Create a named unique property constraint. Backing index will use specified index provider and configuration (optional). Yield: name, labels, properties, providerName, status&quot;</td>
<td>&quot;SCHEMA&quot;</td>
<td>false</td>
</tr>
<tr>
<td>&quot;db.index.fulltext.awaitEventuallyConsistentIndexRefresh&quot;</td>
<td>&quot;Wait for the updates from recently committed transactions to be applied to any eventually-consistent full-text indexes.&quot;</td>
<td>&quot;READ&quot;</td>
<td>true</td>
</tr>
<tr>
<td>name</td>
<td>description</td>
<td>mode</td>
<td>worksOnSystem</td>
</tr>
<tr>
<td>------</td>
<td>-------------</td>
<td>------</td>
<td>---------------</td>
</tr>
<tr>
<td>&quot;db.index.fulltext.createNodeIndex&quot;</td>
<td>&quot;Create a node full-text index for the given labels and properties. The optional 'config' map parameter can be used to supply settings to the index. Supported settings are 'analyzer', for specifying what analyzer to use when indexing and querying. Use the 'db.index.fulltext.listAvailableAnalyzers' procedure to see what options are available. And 'eventually_consistent' which can be set to 'true' to make this index eventually consistent, such that updates from committing transactions are applied in a background thread.&quot;</td>
<td>&quot;SCHEMA&quot;</td>
<td>false</td>
</tr>
<tr>
<td>&quot;db.index.fulltext.createRelationshipIndex&quot;</td>
<td>&quot;Create a relationship full-text index for the given relationship types and properties. The optional 'config' map parameter can be used to supply settings to the index. Supported settings are 'analyzer', for specifying what analyzer to use when indexing and querying. Use the 'db.index.fulltext.listAvailableAnalyzers' procedure to see what options are available. And 'eventually_consistent' which can be set to 'true' to make this index eventually consistent, such that updates from committing transactions are applied in a background thread.&quot;</td>
<td>&quot;SCHEMA&quot;</td>
<td>false</td>
</tr>
<tr>
<td>&quot;db.index.fulltext.drop&quot;</td>
<td>&quot;Drop the specified index.&quot;</td>
<td>&quot;SCHEMA&quot;</td>
<td>false</td>
</tr>
</tbody>
</table>

Rows: 15

### 9.22.3. Listing procedures with filtering on output columns

The listed procedures can be filtered in multiple ways, one way is to use the `WHERE` clause. For example, returning the names of all admin procedures:

**Query**

```
SHOW PROCEDURES YIELD name, admin
WHERE admin
```
### Table 244. Result

<table>
<thead>
<tr>
<th>name</th>
<th>admin</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;db.clearQueryCaches&quot;</td>
<td>true</td>
</tr>
<tr>
<td>&quot;db.listLocks&quot;</td>
<td>true</td>
</tr>
<tr>
<td>&quot;db.prepareForReplanning&quot;</td>
<td>true</td>
</tr>
<tr>
<td>&quot;db.stats.clear&quot;</td>
<td>true</td>
</tr>
<tr>
<td>&quot;db.stats.collect&quot;</td>
<td>true</td>
</tr>
<tr>
<td>&quot;db.stats.retrieve&quot;</td>
<td>true</td>
</tr>
<tr>
<td>&quot;db.stats.retrieveAllAnonymized&quot;</td>
<td>true</td>
</tr>
</tbody>
</table>

Rows: 7

### 9.22.4. Listing procedures with other filtering

The listed procedures can also be filtered by whether a user can execute them. This filtering is only available through the `EXECUTABLE` clause and not through the `WHERE` clause. This is due to using the user’s privileges instead of filtering on the available output columns.

There are two options, how to use the `EXECUTABLE` clause. The first option, is to filter for the current user:

**Query**

```
SHOW PROCEDURES EXECUTABLE BY CURRENT USER YIELD *
```

### Table 245. Result

<table>
<thead>
<tr>
<th>name</th>
<th>description</th>
<th>rolesExecution</th>
<th>rolesBoostedExecution</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;db.awaitIndex&quot;</td>
<td>&quot;Wait for an index to come online (for example: CALL db.awaitIndex(&quot;MyIndex&quot;, 300)).&quot;</td>
<td>&lt;null&gt;</td>
<td>&lt;null&gt;</td>
</tr>
<tr>
<td>&quot;db.awaitIndexes&quot;</td>
<td>&quot;Wait for all indexes to come online (for example: CALL db.awaitIndexes(300)).&quot;</td>
<td>&lt;null&gt;</td>
<td>&lt;null&gt;</td>
</tr>
<tr>
<td>&quot;db.checkpoint&quot;</td>
<td>&quot;Initiate and wait for a new check point, or wait any already on-going check point to complete. Note that this temporarily disables the 'dbms.checkpoint.iops.limit' setting in order to make the check point complete faster. This might cause transaction throughput to degrade slightly, due to increased IO load.&quot;</td>
<td>&lt;null&gt;</td>
<td>&lt;null&gt;</td>
</tr>
</tbody>
</table>
### Table 246. Result

<tr>
<td>&quot;db.createUniquePropertyConstraint&quot;</td>
<td>&quot;Create a named unique property constraint. Backing index will use specified index provider and configuration (optional). Yield: name, labels, properties, providerName, status&quot;</td>
<td>&quot;SCHEMA&quot;</td>
<td>false</td>
</tr>
</tbody>
</table>

Rows: 10

Chapter 10. Functions

This section contains information on all functions in the Cypher query language.

- Predicate functions [Summary|Detail]
- Scalar functions [Summary|Detail]
- Aggregating functions [Summary|Detail]
- List functions [Summary|Detail]
- Mathematical functions - numeric [Summary|Detail]
- Mathematical functions - logarithmic [Summary|Detail]
- Mathematical functions - trigonometric [Summary|Detail]
- String functions [Summary|Detail]
- Temporal functions - instant types [Summary|Detail]
- Temporal functions - duration [Summary|Detail]
- Spatial functions [Summary|Detail]
- LOAD CSV functions [Summary|Detail]
- User-defined functions [Summary|Detail]

Related information may be found in Operators.

Please note

- Functions in Cypher return null if an input parameter is null.
- Functions taking a string as input all operate on Unicode characters rather than on a standard char[]. For example, the size() function applied to any Unicode character will return 1, even if the character does not fit in the 16 bits of one char.

Example 5. List available functions

To list the available functions, run the following Cypher query:

```
SHOW FUNCTIONS
```

Predicate functions

These functions return either true or false for the given arguments.

<table>
<thead>
<tr>
<th>Function</th>
<th>Signature</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>all()</td>
<td>all(variable :: VARIABLE IN list :: LIST OF ANY? WHERE predicate :: ANY?) :: (BOOLEAN?)</td>
<td>Returns true if the predicate holds for all elements in the given list.</td>
</tr>
<tr>
<td>Function</td>
<td>Signature</td>
<td>Description</td>
</tr>
<tr>
<td>-------------</td>
<td>---------------------------------------------------------------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>any()</td>
<td>any(variable :: VARIABLE IN list :: LIST OF ANY? WHERE predicate :: ANY?) :: (BOOLEAN?)</td>
<td>Returns true if the predicate holds for at least one element in the given list.</td>
</tr>
<tr>
<td>exists()</td>
<td>exists(input :: ANY?) :: (BOOLEAN?)</td>
<td>Returns true if a match for the pattern exists in the graph, or if the specified property exists in the node, relationship or map.</td>
</tr>
<tr>
<td>isEmpty()</td>
<td>isEmpty(input :: LIST? OF ANY?) :: (BOOLEAN?)</td>
<td>Checks whether a list is empty.</td>
</tr>
<tr>
<td></td>
<td>isEmpty(input :: MAP?) :: (BOOLEAN?)</td>
<td>Checks whether a map is empty.</td>
</tr>
<tr>
<td></td>
<td>isEmpty(input :: STRING?) :: (BOOLEAN?)</td>
<td>Checks whether a string is empty.</td>
</tr>
<tr>
<td>none()</td>
<td>none(variable :: VARIABLE IN list :: LIST OF ANY? WHERE predicate :: ANY?) :: (BOOLEAN?)</td>
<td>Returns true if the predicate holds for no element in the given list.</td>
</tr>
<tr>
<td>single()</td>
<td>single(variable :: VARIABLE IN list :: LIST OF ANY? WHERE predicate :: ANY?) :: (BOOLEAN?)</td>
<td>Returns true if the predicate holds for exactly one of the elements in the given list.</td>
</tr>
</tbody>
</table>

**Scalar functions**

These functions return a single value.

<table>
<thead>
<tr>
<th>Function</th>
<th>Signature</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>coalesce()</td>
<td>coalesce(input :: ANY?) :: (ANY?)</td>
<td>Returns the first non-null value in a list of expressions.</td>
</tr>
<tr>
<td>endNode()</td>
<td>endNode(input :: RELATIONSHIP?) :: (NODE?)</td>
<td>Returns the end node of a relationship.</td>
</tr>
<tr>
<td>head()</td>
<td>head(list :: LIST? OF ANY?) :: (ANY?)</td>
<td>Returns the first element in a list.</td>
</tr>
<tr>
<td>id()</td>
<td>id(input :: NODE?) :: (INTEGER?)</td>
<td>Returns the id of a node.</td>
</tr>
<tr>
<td></td>
<td>id(input :: RELATIONSHIP?) :: (INTEGER?)</td>
<td>Returns the id of a relationship.</td>
</tr>
<tr>
<td>last()</td>
<td>last(list :: LIST? OF ANY?) :: (ANY?)</td>
<td>Returns the last element in a list.</td>
</tr>
<tr>
<td>length()</td>
<td>length(input :: PATH?) :: (INTEGER?)</td>
<td>Returns the length of a path.</td>
</tr>
<tr>
<td>properties()</td>
<td>properties(input :: MAP?) :: (MAP?)</td>
<td>Returns a map containing all the properties of a map.</td>
</tr>
<tr>
<td></td>
<td>properties(input :: NODE?) :: (MAP?)</td>
<td>Returns a map containing all the properties of a node.</td>
</tr>
<tr>
<td></td>
<td>properties(input :: RELATIONSHIP?) :: (MAP?)</td>
<td>Returns a map containing all the properties of a relationship.</td>
</tr>
<tr>
<td>randomUUID()</td>
<td>randomUUID() :: (STRING?)</td>
<td>Generates a random UUID.</td>
</tr>
<tr>
<td>Function</td>
<td>Signature</td>
<td>Description</td>
</tr>
<tr>
<td>-------------------</td>
<td>------------------------------------------</td>
<td>---------------------------------------------------------------</td>
</tr>
<tr>
<td>size()</td>
<td>size(input :: LIST? OF ANY?) :: (INTEGER?)</td>
<td>Returns the number of items in a list.</td>
</tr>
<tr>
<td></td>
<td>size(input :: STRING?) :: (INTEGER?)</td>
<td>Returns the number of Unicode characters in a string.</td>
</tr>
<tr>
<td>startNode()</td>
<td>startNode(input :: RELATIONSHIP?) :: (NODE?)</td>
<td>Returns the start node of a relationship.</td>
</tr>
<tr>
<td>toBoolean()</td>
<td>toBoolean(input :: STRING?) :: (BOOLEAN?)</td>
<td>Converts a string value to a boolean value.</td>
</tr>
<tr>
<td></td>
<td>toBoolean(input :: BOOLEAN?) :: (BOOLEAN?)</td>
<td>Converts a boolean value to a boolean value.</td>
</tr>
<tr>
<td></td>
<td>toBoolean(input :: INTEGER?) :: (BOOLEAN?)</td>
<td>Converts an integer value to a boolean value.</td>
</tr>
<tr>
<td>toBooleanOrNull()</td>
<td>toBooleanOrNull(input :: ANY?) :: (BOOLEAN?)</td>
<td>Converts a value to a boolean value, or null if the value cannot be converted.</td>
</tr>
<tr>
<td>toFloat()</td>
<td>toFloat(input :: NUMBER?) :: (FLOAT?)</td>
<td>Converts a number value to a floating point value.</td>
</tr>
<tr>
<td></td>
<td>toFloat(input :: STRING?) :: (FLOAT?)</td>
<td>Converts a string value to a floating point value.</td>
</tr>
<tr>
<td>toFloatOrNull()</td>
<td>toFloatOrNull(input :: ANY?) :: (FLOAT?)</td>
<td>Converts a value to a floating point value, or null if the value cannot be converted.</td>
</tr>
<tr>
<td>toInteger()</td>
<td>toInteger(input :: NUMBER?) :: (INTEGER?)</td>
<td>Converts a number value to an integer value.</td>
</tr>
<tr>
<td></td>
<td>toInteger(input :: BOOLEAN?) :: (INTEGER?)</td>
<td>Converts a boolean value to an integer value.</td>
</tr>
<tr>
<td></td>
<td>toInteger(input :: STRING?) :: (INTEGER?)</td>
<td>Converts a string value to an integer value.</td>
</tr>
<tr>
<td>toIntegerOrNull()</td>
<td>toIntegerOrNull(input :: ANY?) :: (INTEGER?)</td>
<td>Converts a value to an integer value, or null if the value cannot be converted.</td>
</tr>
<tr>
<td>type()</td>
<td>type(input :: RELATIONSHIP?) :: (STRING?)</td>
<td>Returns the string representation of the relationship type.</td>
</tr>
</tbody>
</table>

### Aggregating functions

These functions take multiple values as arguments, and calculate and return an aggregated value from them.
<table>
<thead>
<tr>
<th>Function</th>
<th>Signature</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>avg()</td>
<td>avg(input :: DURATION?) :: (DURATION?)</td>
<td>Returns the average of a set of duration values.</td>
</tr>
<tr>
<td></td>
<td>avg(input :: FLOAT?) :: (FLOAT?)</td>
<td>Returns the average of a set of floating point values.</td>
</tr>
<tr>
<td></td>
<td>avg(input :: INTEGER?) :: (INTEGER?)</td>
<td>Returns the average of a set of integer values.</td>
</tr>
<tr>
<td>collect()</td>
<td>collect(input :: ANY?) :: (LIST? OF ANY?)</td>
<td>Returns a list containing the values returned by an expression.</td>
</tr>
<tr>
<td>count()</td>
<td>count(input :: ANY?) :: (INTEGER?)</td>
<td>Returns the number of values or rows.</td>
</tr>
<tr>
<td>max()</td>
<td>max(input :: ANY?) :: (ANY?)</td>
<td>Returns the maximum value in a set of values.</td>
</tr>
<tr>
<td>min()</td>
<td>min(input :: ANY?) :: (ANY?)</td>
<td>Returns the minimum value in a set of values.</td>
</tr>
<tr>
<td>percentileCont()</td>
<td>percentileCont(input :: FLOAT?, percentile :: FLOAT?) :: (FLOAT?)</td>
<td>Returns the percentile of a value over a group using linear interpolation.</td>
</tr>
<tr>
<td>percentileDisc()</td>
<td>percentileDisc(input :: FLOAT?, percentile :: FLOAT?) :: (FLOAT?)</td>
<td>Returns the nearest floating point value to the given percentile over a group using a rounding method.</td>
</tr>
<tr>
<td></td>
<td>percentileDisc(input :: INTEGER?, percentile :: FLOAT?) :: (INTEGER?)</td>
<td>Returns the nearest integer value to the given percentile over a group using a rounding method.</td>
</tr>
<tr>
<td>stdev()</td>
<td>stdev(input :: FLOAT?) :: (FLOAT?)</td>
<td>Returns the standard deviation for the given value over a group for a sample of a population.</td>
</tr>
<tr>
<td>stdevp()</td>
<td>stdevp(input :: FLOAT?) :: (FLOAT?)</td>
<td>Returns the standard deviation for the given value over a group for an entire population.</td>
</tr>
<tr>
<td>sum()</td>
<td>sum(input :: DURATION?) :: (DURATION?)</td>
<td>Returns the sum of a set of durations</td>
</tr>
<tr>
<td></td>
<td>sum(input :: FLOAT?) :: (FLOAT?)</td>
<td>Returns the sum of a set of floats</td>
</tr>
<tr>
<td></td>
<td>sum(input :: INTEGER?) :: (INTEGER?)</td>
<td>Returns the sum of a set of integers</td>
</tr>
</tbody>
</table>

**List functions**

These functions return lists of other values. Further details and examples of lists may be found in [Lists](#).
<table>
<thead>
<tr>
<th>Function</th>
<th>Signature</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>keys()</td>
<td>keys(input :: MAP?) :: (LIST? OF STRING?)</td>
<td>Returns a list containing the string representations for all the property names of a map.</td>
</tr>
<tr>
<td></td>
<td>keys(input :: NODE?) :: (LIST? OF STRING?)</td>
<td>Returns a list containing the string representations for all the property names of a node.</td>
</tr>
<tr>
<td></td>
<td>keys(input :: RELATIONSHIP?) :: (LIST? OF STRING?)</td>
<td>Returns a list containing the string representations for all the property names of a relationship.</td>
</tr>
<tr>
<td>labels()</td>
<td>labels(input :: NODE?) :: (LIST? OF STRING?)</td>
<td>Returns a list containing the string representations for all the labels of a node.</td>
</tr>
<tr>
<td>nodes()</td>
<td>nodes(input :: PATH?) :: (LIST? OF NODE?)</td>
<td>Returns a list containing all the nodes in a path.</td>
</tr>
<tr>
<td>range()</td>
<td>range(start :: INTEGER?, end :: INTEGER?) :: (LIST? OF INTEGER?)</td>
<td>Returns a list comprising all integer values within a specified range.</td>
</tr>
<tr>
<td></td>
<td>range(start :: INTEGER?, end :: INTEGER?, step :: INTEGER?) :: (LIST? OF INTEGER?)</td>
<td>Returns a list comprising all integer values within a specified range created with step length.</td>
</tr>
<tr>
<td>reduce()</td>
<td>reduce(accumulator :: VARIABLE = initial :: ANY?, variable :: VARIABLE IN list :: LIST OF ANY?</td>
<td>Runs an expression against individual elements of a list, storing the result of the expression in an accumulator.</td>
</tr>
<tr>
<td></td>
<td>expression :: ANY) :: (ANY?)</td>
<td></td>
</tr>
<tr>
<td>relationships()</td>
<td>relationships(input :: PATH?) :: (LIST? OF RELATIONSHIP?)</td>
<td>Returns a list containing all the relationships in a path.</td>
</tr>
<tr>
<td>reverse()</td>
<td>reverse(input :: LIST? OF ANY?) :: (LIST? OF ANY?)</td>
<td>Returns a list in which the order of all elements in the original list have been reversed.</td>
</tr>
<tr>
<td>tail()</td>
<td>tail(input :: LIST? OF ANY?) :: (LIST? OF ANY?)</td>
<td>Returns all but the first element in a list.</td>
</tr>
<tr>
<td>toBooleanList()</td>
<td>toBooleanList(input :: LIST? OF ANY?) :: (LIST? OF BOOLEAN?)</td>
<td>Converts a list of values to a list of boolean values. If any values are not convertible to boolean they will be null in the list returned.</td>
</tr>
<tr>
<td>toFloatList()</td>
<td>toFloatList(input :: LIST? OF ANY?) :: (LIST? OF FLOAT?)</td>
<td>Converts a list of values to a list of floating point values. If any values are not convertible to floating point they will be null in the list returned.</td>
</tr>
<tr>
<td>toIntegerList()</td>
<td>toIntegerList(input :: LIST? OF ANY?) :: (LIST? OF INTEGER?)</td>
<td>Converts a list of values to a list of integer values. If any values are not convertible to integer they will be null in the list returned.</td>
</tr>
<tr>
<td>Function</td>
<td>Signature</td>
<td>Description</td>
</tr>
<tr>
<td>---------------</td>
<td>----------------------------------------------------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>toStringList()</td>
<td><code>toStringList(input :: LIST? OF ANY?) :: (LIST? OF STRING?)</code></td>
<td>Converts a list of values to a list of string values. If any values are not convertible to string they will be null in the list returned.</td>
</tr>
</tbody>
</table>

### Numeric functions

These functions all operate on numerical expressions only, and will return an error if used on any other values.

<table>
<thead>
<tr>
<th>Function</th>
<th>Signature</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>abs()</td>
<td><code>abs(input :: FLOAT?) :: (FLOAT?)</code></td>
<td>Returns the absolute value of a floating point number.</td>
</tr>
<tr>
<td></td>
<td><code>abs(input :: INTEGER?) :: (INTEGER?)</code></td>
<td>Returns the absolute value of an integer.</td>
</tr>
<tr>
<td>ceil()</td>
<td><code>ceil(input :: FLOAT?) :: (FLOAT?)</code></td>
<td>Returns the smallest floating point number that is greater than or equal to a number and equal to a mathematical integer.</td>
</tr>
<tr>
<td>floor()</td>
<td><code>floor(input :: FLOAT?) :: (FLOAT?)</code></td>
<td>Returns the largest floating point number that is less than or equal to a number and equal to a mathematical integer.</td>
</tr>
<tr>
<td>rand()</td>
<td><code>rand() :: (FLOAT?)</code></td>
<td>Returns a random floating point number in the range from 0 (inclusive) to 1 (exclusive); i.e. ([0,1)).</td>
</tr>
<tr>
<td>round()</td>
<td><code>round(input :: FLOAT?) :: (FLOAT?)</code></td>
<td>Returns the value of a number rounded to the nearest integer.</td>
</tr>
<tr>
<td></td>
<td><code>round(value :: FLOAT?, precision :: NUMBER?) :: (FLOAT?)</code></td>
<td>Returns the value of a number rounded to the specified precision using rounding mode HALF_UP.</td>
</tr>
<tr>
<td></td>
<td><code>round(value :: FLOAT?, precision :: NUMBER?, mode :: STRING?) :: (FLOAT?)</code></td>
<td>Returns the value of a number rounded to the specified precision with the specified rounding mode.</td>
</tr>
<tr>
<td>sign()</td>
<td><code>sign(input :: FLOAT?) :: (INTEGER?)</code></td>
<td>Returns the signum of a floating point number: 0 if the number is 0, -1 for any negative number, and 1 for any positive number.</td>
</tr>
<tr>
<td></td>
<td><code>sign(input :: INTEGER?) :: (INTEGER?)</code></td>
<td>Returns the signum of an integer number: 0 if the number is 0, -1 for any negative number, and 1 for any positive number.</td>
</tr>
</tbody>
</table>

### Logarithmic functions

These functions all operate on numerical expressions only, and will return an error if used on any other values.
<table>
<thead>
<tr>
<th>Function</th>
<th>Signature</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>e()</td>
<td>e() :: (FLOAT?)</td>
<td>Returns the base of the natural logarithm, e.</td>
</tr>
<tr>
<td>exp()</td>
<td>exp(input :: FLOAT?) :: (FLOAT?)</td>
<td>Returns $e^n$, where $e$ is the base of the natural logarithm, and $n$ is the value of the argument expression.</td>
</tr>
<tr>
<td>log()</td>
<td>log(input :: FLOAT?) :: (FLOAT?)</td>
<td>Returns the natural logarithm of a number.</td>
</tr>
<tr>
<td>log10()</td>
<td>log10(input :: FLOAT?) :: (FLOAT?)</td>
<td>Returns the common logarithm (base 10) of a number.</td>
</tr>
<tr>
<td>sqrt()</td>
<td>sqrt(input :: FLOAT?) :: (FLOAT?)</td>
<td>Returns the square root of a number.</td>
</tr>
</tbody>
</table>

**Trigonometric functions**

These functions all operate on numerical expressions only, and will return an error if used on any other values.

All trigonometric functions operate on radians, unless otherwise specified.

<table>
<thead>
<tr>
<th>Function</th>
<th>Signature</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>acos()</td>
<td>acos(input :: FLOAT?) :: (FLOAT?)</td>
<td>Returns the arccosine of a number in radians.</td>
</tr>
<tr>
<td>asin()</td>
<td>asin(input :: FLOAT?) :: (FLOAT?)</td>
<td>Returns the arcsine of a number in radians.</td>
</tr>
<tr>
<td>atan()</td>
<td>atan(input :: FLOAT?) :: (FLOAT?)</td>
<td>Returns the arctangent of a number in radians.</td>
</tr>
<tr>
<td>atan2()</td>
<td>atan2(y :: FLOAT?, x :: FLOAT?) :: (FLOAT?)</td>
<td>Returns the arctangent2 of a set of coordinates in radians.</td>
</tr>
<tr>
<td>cos()</td>
<td>cos(input :: FLOAT?) :: (FLOAT?)</td>
<td>Returns the cosine of a number.</td>
</tr>
<tr>
<td>cot()</td>
<td>cot(input :: FLOAT?) :: (FLOAT?)</td>
<td>Returns the cotangent of a number.</td>
</tr>
<tr>
<td>degrees()</td>
<td>degrees(input :: FLOAT?) :: (FLOAT?)</td>
<td>Converts radians to degrees.</td>
</tr>
<tr>
<td>haversin()</td>
<td>haversin(input :: FLOAT?) :: (FLOAT?)</td>
<td>Returns half the versine of a number.</td>
</tr>
<tr>
<td>pi()</td>
<td>pi() :: (FLOAT?)</td>
<td>Returns the mathematical constant pi.</td>
</tr>
<tr>
<td>radians()</td>
<td>radians(input :: FLOAT?) :: (FLOAT?)</td>
<td>Converts degrees to radians.</td>
</tr>
<tr>
<td>sin()</td>
<td>sin(input :: FLOAT?) :: (FLOAT?)</td>
<td>Returns the sine of a number.</td>
</tr>
<tr>
<td>tan()</td>
<td>tan(input :: FLOAT?) :: (FLOAT?)</td>
<td>Returns the tangent of a number.</td>
</tr>
</tbody>
</table>

**String functions**

These functions are used to manipulate strings or to create a string representation of another value.
<table>
<thead>
<tr>
<th>Function</th>
<th>Signature</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>left()</td>
<td>left(original :: STRING?, length :: INTEGER?) :: (STRING?)</td>
<td>Returns a string containing the specified number of leftmost characters of the original string.</td>
</tr>
<tr>
<td>ltrim()</td>
<td>ltrim(input :: STRING?) :: (STRING?)</td>
<td>Returns the original string with leading whitespace removed.</td>
</tr>
<tr>
<td>replace()</td>
<td>replace(original :: STRING?, search :: STRING?, replace :: STRING?) :: (STRING?)</td>
<td>Returns a string in which all occurrences of a specified search string in the original string have been replaced by another (specified) replace string.</td>
</tr>
<tr>
<td>reverse()</td>
<td>reverse(input :: STRING?) :: (STRING?)</td>
<td>Returns a string in which the order of all characters in the original string have been reversed.</td>
</tr>
<tr>
<td>right()</td>
<td>right(original :: STRING?, length :: INTEGER?) :: (STRING?)</td>
<td>Returns a string containing the specified number of rightmost characters of the original string.</td>
</tr>
<tr>
<td>rtrim()</td>
<td>rtrim(input :: STRING?) :: (STRING?)</td>
<td>Returns the original string with trailing whitespace removed.</td>
</tr>
<tr>
<td>split()</td>
<td>split(original :: STRING?, splitDelimiter :: STRING?) :: (LIST? OF STRING?)</td>
<td>Returns a list of strings resulting from the splitting of the original string around matches of the given delimiter.</td>
</tr>
<tr>
<td></td>
<td>split(original :: STRING?, splitDelimiters :: LIST? OF STRING?) :: (LIST? OF STRING?)</td>
<td>Returns a list of strings resulting from the splitting of the original string around matches of any of the given delimiters.</td>
</tr>
<tr>
<td>substring()</td>
<td>substring(original :: STRING?, start :: INTEGER?) :: (STRING?)</td>
<td>Returns a substring of the original string, beginning with a 0-based index start.</td>
</tr>
<tr>
<td></td>
<td>substring(original :: STRING?, start :: INTEGER?, length :: INTEGER?) :: (STRING?)</td>
<td>Returns a substring of length 'length' of the original string, beginning with a 0-based index start.</td>
</tr>
<tr>
<td>toLower()</td>
<td>toLower(input :: STRING?) :: (STRING?)</td>
<td>Returns the original string in lowercase.</td>
</tr>
<tr>
<td>toString()</td>
<td>toString(input :: ANY?) :: (STRING?)</td>
<td>Converts an integer, float, boolean, point or temporal type (i.e. Date, Time, LocalTime, DateTime, LocalDateTime or Duration) value to a string.</td>
</tr>
<tr>
<td>toStringOrNull()</td>
<td>toStringOrNull(input :: ANY?) :: (STRING?)</td>
<td>Converts an integer, float, boolean, point or temporal type (i.e. Date, Time, LocalTime, DateTime, LocalDateTime or Duration) value to a string, or null if the value cannot be converted.</td>
</tr>
<tr>
<td>toUpper()</td>
<td>toUpper(input :: STRING?) :: (STRING?)</td>
<td>Returns the original string in uppercase.</td>
</tr>
<tr>
<td>trim()</td>
<td>trim(input :: STRING?) :: (STRING?)</td>
<td>Returns the original string with leading and trailing whitespace removed.</td>
</tr>
</tbody>
</table>
### Temporal instant types functions

Values of the **temporal types** — Date, Time, LocalTime, DateTime, and LocalDateTime — can be created manipulated using the following functions:

<table>
<thead>
<tr>
<th>Function</th>
<th>Signature</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>date()</td>
<td>date(input = DEFAULT_TEMPORAL_ARGUMENT :: ANY?) :: (DATE?)</td>
<td>Create a Date instant.</td>
</tr>
<tr>
<td>date.realtime()</td>
<td>date.realtime(timezone = DEFAULT_TEMPORAL_ARGUMENT :: ANY?) :: (DATE?)</td>
<td>Get the current Date instant using the realtime clock.</td>
</tr>
<tr>
<td>date.statement()</td>
<td>date.statement(timezone = DEFAULT_TEMPORAL_ARGUMENT :: ANY?) :: (DATE?)</td>
<td>Get the current Date instant using the statement clock.</td>
</tr>
<tr>
<td>date.transaction()</td>
<td>date.transaction(timezone = DEFAULT_TEMPORAL_ARGUMENT :: ANY?) :: (DATE?)</td>
<td>Get the current Date instant using the transaction clock.</td>
</tr>
<tr>
<td>date.truncate()</td>
<td>date.truncate(unit :: STRING?, input = DEFAULT_TEMPORAL_ARGUMENT :: ANY?, fields = null :: MAP?) :: (DATE?)</td>
<td>Truncate the input temporal value to a Date instant using the specified unit.</td>
</tr>
<tr>
<td>datetime()</td>
<td>datetime(input = DEFAULT_TEMPORAL_ARGUMENT :: ANY?) :: (DATETIME?)</td>
<td>Create a DateTime instant.</td>
</tr>
<tr>
<td>datetime.fromepoch()</td>
<td>datetime.fromepoch(seconds :: NUMBER?, nanoseconds :: NUMBER?) :: (DATETIME?)</td>
<td>Create a DateTime given the seconds and nanoseconds since the start of the epoch.</td>
</tr>
<tr>
<td>datetime.fromepochmillis()</td>
<td>datetime.fromepochmillis(milliseconds :: NUMBER?) :: (DATETIME?)</td>
<td>Create a DateTime given the milliseconds since the start of the epoch.</td>
</tr>
<tr>
<td>datetime.realtime()</td>
<td>datetime.realtime(timezone = DEFAULT_TEMPORAL_ARGUMENT :: ANY?) :: (DATETIME?)</td>
<td>Get the current DateTime instant using the realtime clock.</td>
</tr>
<tr>
<td>datetime.statement()</td>
<td>datetime.statement(timezone = DEFAULT_TEMPORAL_ARGUMENT :: ANY?) :: (DATETIME?)</td>
<td>Get the current DateTime instant using the statement clock.</td>
</tr>
<tr>
<td>datetime.transaction()</td>
<td>datetime.transaction(timezone = DEFAULT_TEMPORAL_ARGUMENT :: ANY?) :: (DATETIME?)</td>
<td>Get the current DateTime instant using the transaction clock.</td>
</tr>
<tr>
<td>datetime.truncate()</td>
<td>datetime.truncate(unit :: STRING?, input = DEFAULT_TEMPORAL_ARGUMENT :: ANY?, fields = null :: MAP?) :: (DATETIME?)</td>
<td>Truncate the input temporal value to a DateTime instant using the specified unit.</td>
</tr>
<tr>
<td>localdatetime()</td>
<td>localdatetime(input = DEFAULT_TEMPORAL_ARGUMENT :: ANY?) :: (LOCALDATETIME?)</td>
<td>Create a LocalDateTime instant.</td>
</tr>
<tr>
<td>localdatetime.realtime()</td>
<td>localdatetime.realtime(timezone = DEFAULT_TEMPORAL_ARGUMENT :: ANY?) :: (LOCALDATETIME?)</td>
<td>Get the current LocalDateTime instant using the realtime clock.</td>
</tr>
<tr>
<td>localdatetime.statement()</td>
<td>localdatetime.statement(timezone = DEFAULT_TEMPORAL_ARGUMENT :: ANY?) :: (LOCALDATETIME?)</td>
<td>Get the current LocalDateTime instant using the statement clock.</td>
</tr>
</tbody>
</table>
### Function Signature Description

<table>
<thead>
<tr>
<th>Function</th>
<th>Signature</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>localdatetime.transaction()</code></td>
<td><code>localdatetime.transaction(timezone = DEFAULT_TEMPORAL_ARGUMENT :: ANY?) :: (LOCALDATETIME?)</code></td>
<td>Get the current LocalDateTime instant using the transaction clock.</td>
</tr>
<tr>
<td><code>localdatetime.truncate()</code></td>
<td><code>localdatetime.truncate(unit :: STRING?, input = DEFAULT_TEMPORAL_ARGUMENT :: ANY?, fields = null :: MAP?) :: (LOCALDATETIME?)</code></td>
<td>Truncate the input temporal value to a LocalDateTime instant using the specified unit.</td>
</tr>
<tr>
<td><code>localtime()</code></td>
<td><code>localtime(input = DEFAULT_TEMPORAL_ARGUMENT :: ANY?) :: (LOCALTIME?)</code></td>
<td>Create a LocalTime instant.</td>
</tr>
<tr>
<td><code>localtime.realtime()</code></td>
<td><code>localtime.realtime(timezone = DEFAULT_TEMPORAL_ARGUMENT :: ANY?) :: (LOCALTIME?)</code></td>
<td>Get the current LocalTime instant using the realtime clock.</td>
</tr>
<tr>
<td><code>localtime.statement()</code></td>
<td><code>localtime.statement(timezone = DEFAULT_TEMPORAL_ARGUMENT :: ANY?) :: (LOCALTIME?)</code></td>
<td>Get the current LocalTime instant using the statement clock.</td>
</tr>
<tr>
<td><code>localtime.transaction()</code></td>
<td><code>localtime.transaction(timezone = DEFAULT_TEMPORAL_ARGUMENT :: ANY?) :: (LOCALTIME?)</code></td>
<td>Get the current LocalTime instant using the transaction clock.</td>
</tr>
<tr>
<td><code>localtime.truncate()</code></td>
<td><code>localtime.truncate(unit :: STRING?, input = DEFAULT_TEMPORAL_ARGUMENT :: ANY?, fields = null :: MAP?) :: (LOCALTIME?)</code></td>
<td>Truncate the input temporal value to a LocalTime instant using the specified unit.</td>
</tr>
<tr>
<td><code>time()</code></td>
<td><code>time(input = DEFAULT_TEMPORAL_ARGUMENT :: ANY?) :: (TIME?)</code></td>
<td>Create a Time instant.</td>
</tr>
<tr>
<td><code>time.realtime()</code></td>
<td><code>time.realtime(timezone = DEFAULT_TEMPORAL_ARGUMENT :: ANY?) :: (TIME?)</code></td>
<td>Get the current Time instant using the realtime clock.</td>
</tr>
<tr>
<td><code>time.statement()</code></td>
<td><code>time.statement(timezone = DEFAULT_TEMPORAL_ARGUMENT :: ANY?) :: (TIME?)</code></td>
<td>Get the current Time instant using the statement clock.</td>
</tr>
<tr>
<td><code>time.transaction()</code></td>
<td><code>time.transaction(timezone = DEFAULT_TEMPORAL_ARGUMENT :: ANY?) :: (TIME?)</code></td>
<td>Get the current Time instant using the transaction clock.</td>
</tr>
<tr>
<td><code>time.truncate()</code></td>
<td><code>time.truncate(unit :: STRING?, input = DEFAULT_TEMPORAL_ARGUMENT :: ANY?, fields = null :: MAP?) :: (TIME?)</code></td>
<td>Truncate the input temporal value to a Time instant using the specified unit.</td>
</tr>
</tbody>
</table>

### Temporal duration functions

Duration values of the temporal types can be created manipulated using the following functions:

<table>
<thead>
<tr>
<th>Function</th>
<th>Signature</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>duration()</code></td>
<td><code>duration(input :: ANY?) :: (DURATION?)</code></td>
<td>Construct a Duration value.</td>
</tr>
<tr>
<td><code>duration.between()</code></td>
<td><code>duration.between(from :: ANY?, to :: ANY?) :: (DURATION?)</code></td>
<td>Compute the duration between the 'from' instant (inclusive) and the 'to' instant (exclusive) in logical units.</td>
</tr>
<tr>
<td>Function</td>
<td>Signature</td>
<td>Description</td>
</tr>
<tr>
<td>-------------------------</td>
<td>-----------------------------------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>duration.inDays()</td>
<td>duration.inDays(from :: ANY?, to :: ANY?) :: (DURATION?)</td>
<td>Compute the duration between the 'from' instant (inclusive) and the 'to' instant (exclusive) in days.</td>
</tr>
<tr>
<td>duration.inMonths()</td>
<td>duration.inMonths(from :: ANY?, to :: ANY?) :: (DURATION?)</td>
<td>Compute the duration between the 'from' instant (inclusive) and the 'to' instant (exclusive) in months.</td>
</tr>
<tr>
<td>duration.inSeconds()</td>
<td>duration.inSeconds(from :: ANY?, to :: ANY?) :: (DURATION?)</td>
<td>Compute the duration between the 'from' instant (inclusive) and the 'to' instant (exclusive) in seconds.</td>
</tr>
</tbody>
</table>

**Spatial functions**

These functions are used to specify 2D or 3D points in a geographic or cartesian Coordinate Reference System and to calculate the geodesic distance between two points.

<table>
<thead>
<tr>
<th>Function</th>
<th>Signature</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>distance()</td>
<td>distance(from :: POINT?, to :: POINT?) :: (FLOAT?)</td>
<td>Returns a floating point number representing the geodesic distance between any two points in the same CRS.</td>
</tr>
<tr>
<td>point() - Cartesian 2D</td>
<td>point(input :: MAP?) :: (POINT?)</td>
<td>Returns a 2D point object, given two coordinate values in the Cartesian coordinate system.</td>
</tr>
<tr>
<td>point() - Cartesian 3D</td>
<td>point(input :: MAP?) :: (POINT?)</td>
<td>Returns a 3D point object, given three coordinate values in the Cartesian coordinate system.</td>
</tr>
<tr>
<td>point() - WGS 84 2D</td>
<td>point(input :: MAP?) :: (POINT?)</td>
<td>Returns a 2D point object, given two coordinate values in the WGS 84 geographic coordinate system.</td>
</tr>
<tr>
<td><code>point()</code> - WGS 84 3D</td>
<td>point(input :: MAP?) :: (POINT?)</td>
<td>Returns a 3D point object, given three coordinate values in the WGS 84 geographic coordinate system.</td>
</tr>
</tbody>
</table>

**LOAD CSV functions**

LOAD CSV functions can be used to get information about the file that is processed by LOAD CSV.

<table>
<thead>
<tr>
<th>Function</th>
<th>Signature</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>file()</td>
<td>file() :: (STRING?)</td>
<td>Returns the absolute path of the file that LOAD CSV is using.</td>
</tr>
<tr>
<td>linenumber()</td>
<td>linenumber() :: (INTEGER?)</td>
<td>Returns the line number that LOAD CSV is currently using.</td>
</tr>
</tbody>
</table>

**User-defined functions**

User-defined functions are written in Java, deployed into the database and are called in the same way as
any other Cypher function. There are two main types of functions that can be developed and used:

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
<th>Usage</th>
<th>Developing</th>
</tr>
</thead>
<tbody>
<tr>
<td>Scalar</td>
<td>For each row the function takes parameters and returns a result</td>
<td>Using UDF</td>
<td>Extending Neo4j (UDF)</td>
</tr>
<tr>
<td>Aggregating</td>
<td>Consumes many rows and produces an aggregated result</td>
<td>Using aggregating UDF</td>
<td>Extending Neo4j (Aggregating UDF)</td>
</tr>
</tbody>
</table>

10.1. Predicate functions

Predicates are boolean functions that return `true` or `false` for a given set of non-`null` input. They are most commonly used to filter out paths in the **WHERE** part of a query.

Functions:
- `all()`
- `any()`
- `exists()`
- `isEmpty()`
- `none()`
- `single()`

10.1.1. `all()`

The function `all()` returns `true` if the predicate holds for all elements in the given list. `null` is returned if the list is `null` or all of its elements are `null`.

**Syntax:** `all(variable IN list WHERE predicate)`

**Returns:**
A Boolean.

Arguments:

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>list</td>
<td>An expression that returns a list. A single element cannot be explicitly passed as a literal in the cypher statement. However, an implicit conversion will happen for single elements when passing node properties during cypher execution.</td>
</tr>
<tr>
<td>variable</td>
<td>A variable that can be used from within the predicate.</td>
</tr>
<tr>
<td>predicate</td>
<td>A predicate that is tested against all items in the list.</td>
</tr>
</tbody>
</table>

Query

MATCH p = (a)-[*1..3]->(b)
WHERE
  a.name = 'Alice'
  AND b.name = 'Daniel'
  AND all(x IN nodes(p) WHERE x.age > 30)
RETURN p

All nodes in the returned paths will have a property age with a value larger than 30.

Table 247. Result

<table>
<thead>
<tr>
<th>p</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>(0)-[KNOWS,1]-&gt;(2)-[KNOWS,3]-&gt;(3)</td>
<td></td>
</tr>
</tbody>
</table>

Rows: 1

10.1.2. any()

The function any() returns true if the predicate holds for at least one element in the given list. null is returned if the list is null or all of its elements are null.

Syntax: any(variable IN list WHERE predicate)

Returns:

A Boolean.

Arguments:

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>list</td>
<td>An expression that returns a list. A single element cannot be explicitly passed as a literal in the cypher statement. However, an implicit conversion will happen for single elements when passing node properties during cypher execution.</td>
</tr>
<tr>
<td>Name</td>
<td>Description</td>
</tr>
<tr>
<td>------------</td>
<td>--------------------------------------------------</td>
</tr>
<tr>
<td>variable</td>
<td>A variable that can be used from within the predicate.</td>
</tr>
<tr>
<td>predicate</td>
<td>A predicate that is tested against all items in the list.</td>
</tr>
</tbody>
</table>

**Query**

```sql
MATCH (n)
WHERE any(color IN n.liked_colors WHERE color = 'yellow')
RETURN n
```

The query returns nodes with the property `liked_colors` (as a list), where at least one element has the value 'yellow'.

**Table 248. Result**

<table>
<thead>
<tr>
<th>n</th>
</tr>
</thead>
<tbody>
<tr>
<td>Node[4]{eyes:&quot;blue&quot;,liked_colors:[&quot;pink&quot;,&quot;yellow&quot;,&quot;black&quot;],name:&quot;Eskil&quot;,age:41}</td>
</tr>
</tbody>
</table>

Rows: 1

### 10.1.3. exists()

The function `exists()` returns `true` if a match for the given pattern exists in the graph, or if the specified property exists in the node, relationship or map. `null` is returned if the input argument is `null`.

**Syntax:** `exists(pattern-or-property)`

**Returns:**

A Boolean.

**Arguments:**

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>pattern-or-property</td>
<td>A pattern or a property (in the form 'variable.prop').</td>
</tr>
</tbody>
</table>

**Query**

```sql
MATCH (n)
WHERE n.name IS NOT NULL
RETURN n.name AS name,
exists((n)-[:MARRIED]->()) AS is_married
```

The names of all nodes with the `name` property are returned, along with a boolean (true or false) indicating if they are married.

**Table 249. Result**

<table>
<thead>
<tr>
<th>name</th>
<th>is_married</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;Alice&quot;</td>
<td>false</td>
</tr>
</tbody>
</table>
Three nodes are returned: one with a property `name`, one without a property `name`, and one that does not exist (e.g., is `null`). This query exemplifies the behavior of `exists()` when operating on `null` nodes.

Table 250. Result

<table>
<thead>
<tr>
<th>a_name</th>
<th>b_name</th>
<th>b_has_name</th>
<th>c_name</th>
<th>c_has_name</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;Alice&quot;</td>
<td>&lt;null&gt;</td>
<td>false</td>
<td>&lt;null&gt;</td>
<td>&lt;null&gt;</td>
</tr>
</tbody>
</table>

Rows: 1

Note that the `exists()` function is deprecated for property input. Please use the `IS NOT NULL` predicate instead.

10.1.4. isEmpty()

The function `isEmpty()` returns `true` if the given list or map contains no elements or if the given string contains no characters.

Syntax: `isEmpty(list)`

Returns:

A Boolean.

Arguments:
Name | Description
--- | ---
list | An expression that returns a list.

**Query**

```
MATCH (n)
WHERE NOT isEmpty(n.liked_colors)
RETURN n
```

The nodes with the property `liked_colors` being non-empty are returned.

**Table 251. Result**

<table>
<thead>
<tr>
<th>n</th>
</tr>
</thead>
<tbody>
<tr>
<td>Node[4]{eyes:&quot;blue&quot;,liked_colors:[&quot;pink&quot;,&quot;yellow&quot;,&quot;black&quot;],name:&quot;Eskil&quot;,age:41}</td>
</tr>
<tr>
<td>Node[5]{eyes: &quot;,liked_colors:[&quot;blue&quot;,&quot;green&quot;],alias:&quot;Frank&quot;,age:61}</td>
</tr>
</tbody>
</table>

Rows: 2

**Syntax:** `isEmpty(map)`

**Returns:**

A Boolean.

**Arguments:**

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>map</td>
<td>An expression that returns a map.</td>
</tr>
</tbody>
</table>

**Query**

```
MATCH (n)
WHERE isEmpty(properties(n))
RETURN n
```

Nodes that does not have any properties are returned.

**Table 252. Result**

<table>
<thead>
<tr>
<th>n</th>
</tr>
</thead>
<tbody>
<tr>
<td>Node[6]{ }</td>
</tr>
</tbody>
</table>

Rows: 1

**Syntax:** `isEmpty(string)`

**Returns:**

A Boolean.
The age are returned for each node that has a property `eyes` where the value evaluates to be empty (empty string).

### Table 253. Result

<table>
<thead>
<tr>
<th>age</th>
</tr>
</thead>
<tbody>
<tr>
<td>61</td>
</tr>
</tbody>
</table>

Rows: 1

The function `isEmpty()`, like most other Cypher functions, returns `null` if `null` is passed in to the function. That means that a predicate `isEmpty(n.eyes)` will filter out all nodes where the `eyes` property is not set. Thus, `isEmpty()` is not suited to test for null values. `IS NULL` or `IS NOT NULL` should be used for that purpose.

### 10.1.5. none()

The function `none()` returns `true` if the predicate does not hold for any element in the given list. `null` is returned if the list is `null` or all of its elements are `null`.

**Syntax:** none(variable IN list WHERE predicate)

**Returns:** A Boolean.

**Arguments:**

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>list</td>
<td>An expression that returns a list. A single element cannot be explicitly passed as a literal in the cypher statement. However, an implicit conversion will happen for single elements when passing node properties during cypher execution.</td>
</tr>
<tr>
<td>variable</td>
<td>A variable that can be used from within the predicate.</td>
</tr>
<tr>
<td>predicate</td>
<td>A predicate that is tested against all items in the list.</td>
</tr>
</tbody>
</table>
Query

```sql
MATCH p = (n)-[*1..3]->(b)
WHERE
  n.name = 'Alice'
  AND none(x IN nodes(p) WHERE x.age = 25)
RETURN p
```

No node in the returned paths has a property `age` with the value `25`.

Table 254. Result

<table>
<thead>
<tr>
<th>p</th>
</tr>
</thead>
<tbody>
<tr>
<td>(0)-[KNOWS,1]-&gt;(2)</td>
</tr>
<tr>
<td>(0)-[KNOWS,1]-&gt;(2)-[KNOWS,3]-&gt;(3)</td>
</tr>
</tbody>
</table>

Rows: 2

10.1.6. single()

The function `single()` returns `true` if the predicate holds for exactly one of the elements in the given list. `null` is returned if the list is `null` or all of its elements are `null`.

Syntax: `single(variable IN list WHERE predicate)`

Returns:

A Boolean.

Arguments:

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>list</td>
<td>An expression that returns a list.</td>
</tr>
<tr>
<td>variable</td>
<td>A variable that can be used from within the predicate.</td>
</tr>
<tr>
<td>predicate</td>
<td>A predicate that is tested against all items in the list.</td>
</tr>
</tbody>
</table>

Query

```sql
MATCH p = (n)-->(b)
WHERE
  n.name = 'Alice'
  AND single(var IN nodes(p) WHERE var.eyes = 'blue')
RETURN p
```

In every returned path there is exactly one node that has a property `eyes` with the value `'blue'`.

Table 255. Result

<table>
<thead>
<tr>
<th>p</th>
</tr>
</thead>
<tbody>
<tr>
<td>(0)-[KNOWS,0]-&gt;(1)</td>
</tr>
</tbody>
</table>

Rows: 1
10.2. Scalar functions

Scalar functions return a single value.

Functions:

- `coalesce()`
- `endNode()`
- `head()`
- `id()`
- `last()`
- `length()`
- `properties()`
- `randomUUID()`
- `size()`
- `Size of pattern expression`
- `Size of string`
- `startNode()`
- `timestamp()`
- `toBoolean()`
- `toBooleanOrNull()`
- `toFloat()`
- `toFloatOrNull()`
- `toInteger()`
- `toIntegerOrNull()`
- `type()`

The `length()` and `size()` functions are quite similar, and so it is important to take note of the difference.

Function `length()`

Only works for paths.

Function `size()`

Only works for the three types: strings, lists, and pattern expressions.
Graph

10.2.1. coalesce()

The function `coalesce()` returns the first non-null value in the given list of expressions.

**Syntax:** `coalesce(expression [, expression]*)`

**Returns:**

The type of the value returned will be that of the first non-null expression.

**Arguments:**

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>expression</td>
<td>An expression that may return <code>null</code>.</td>
</tr>
</tbody>
</table>

**Considerations:**

`null` will be returned if all the arguments are `null`.

**Query**

```
MATCH (a)
WHERE a.name = 'Alice'
RETURN coalesce(a.hairColor, a.eyes)
```

**Table 256. Result**

<table>
<thead>
<tr>
<th>coalesce(a.hairColor, a.eyes)</th>
<th>&quot;brown&quot;</th>
</tr>
</thead>
<tbody>
<tr>
<td>Rows: 1</td>
<td></td>
</tr>
</tbody>
</table>

10.2.2. endNode()

The function `endNode()` returns the end node of a relationship.
Syntax: `endNode(relationship)`

Returns:

A Node.

Arguments:

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>relationship</td>
<td>An expression that returns a relationship.</td>
</tr>
</tbody>
</table>

Considerations:

`endNode(null)` returns `null`.

Query

```
MATCH (x:Developer)-[r]->()
RETURN endNode(r)
```

Table 257. Result

```
endNode(r)
Node[2]{name:"Charlie",age:53,eyes:"green"}
Node[1]{name:"Bob",age:25,eyes:"blue"}
Rows: 2
```

10.2.3. head()

The function `head()` returns the first element in a list.

Syntax: `head(expression)`

Returns:

The type of the value returned will be that of the first element of the list.

Arguments:

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>expression</td>
<td>An expression that returns a list.</td>
</tr>
</tbody>
</table>

Considerations:

`head(null)` returns `null`.

`head([])` returns `null`.

If the first element in `list` is `null`, `head(list)` will return `null`.
Query
MATCH (a)
WHERE a.name = 'Eskil'
RETURN a.liked_colors, head(a.liked_colors)

The first element in the list is returned.
Table 258. Result
a.liked_colors

head(a.liked_colors)

["pink","yellow","black"]

"pink"

Rows: 1

10.2.4. id()
The function id() returns a node or a relationship identifier, unique by an object type and a database.
Therefore, it is perfectly allowable for id() to return the same value for both nodes and relationships in the
same database. For examples on how to get a node and a relationship by ID, see Get node or relationship
by id.
Neo4j implements the id so that:
Node
Every node in a database has an identifier. The identifier for a node is guaranteed to
be unique among other nodes' identifiers in the same database, within the scope of a



single transaction.
Relationship
Every relationship in a database has an identifier. The identifier for a relationship is
guaranteed to be unique among other relationships' identifiers in the same database,
within the scope of a single transaction.

Syntax: id(expression)
Returns:
An Integer.

Arguments:
Name

Description

expression

An expression that returns a node or a relationship.

Considerations:
id(null) returns null.

222


The node identifier for each of the nodes is returned.

**Table 259. Result**

<table>
<thead>
<tr>
<th>id(a)</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
</tr>
<tr>
<td>1</td>
</tr>
<tr>
<td>2</td>
</tr>
<tr>
<td>3</td>
</tr>
<tr>
<td>4</td>
</tr>
</tbody>
</table>

Rows: 5

10.2.5. last()

The function `last()` returns the last element in a list.

**Syntax:** `last(expression)`

**Returns:**

The type of the value returned will be that of the last element of the list.

**Arguments:**

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>expression</td>
<td>An expression that returns a list.</td>
</tr>
</tbody>
</table>

**Considerations:**

- `last(null)` returns `null`.
- `last([])` returns `null`.
- If the last element in `list` is `null`, `last(list)` will return `null`.

**Query**

```
MATCH (a)
WHERE a.name = 'Eskil'
RETURN a.liked_colors, last(a.liked_colors)
```

The last element in the list is returned.

**Table 260. Result**
10.2.6. length()

The function `length()` returns the length of a path.

**Syntax:** `length(path)`

**Returns:**

An Integer.

**Arguments:**

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>path</td>
<td>An expression that returns a path.</td>
</tr>
</tbody>
</table>

**Considerations:**

`length(null)` returns `null`.

**Query**

```
MATCH p = (a)-->(b)-->(c)
WHERE a.name = 'Alice'
RETURN length(p)
```

The length of the path `p` is returned.

**Table 261. Result**

<table>
<thead>
<tr>
<th>length(p)</th>
</tr>
</thead>
<tbody>
<tr>
<td>2</td>
</tr>
<tr>
<td>2</td>
</tr>
<tr>
<td>2</td>
</tr>
</tbody>
</table>

10.2.7. properties()

The function `properties()` returns a map containing all the properties; the function can be utilized for a relationship or a node. If the argument is already a map, it is returned unchanged.

**Syntax:** `properties(expression)`

**Returns:**
A Map.

Arguments:

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>expression</td>
<td>An expression that returns a relationship, a node, or a map.</td>
</tr>
</tbody>
</table>

Considerations:

- properties(null) returns null.

Query

```sql
CREATE (p:Person {name: 'Stefan', city: 'Berlin'})
RETURN properties(p)
```

Table 262. Result

<table>
<thead>
<tr>
<th>properties(p)</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>{city -&gt; &quot;Berlin&quot;, name -&gt; &quot;Stefan&quot;}</code></td>
</tr>
</tbody>
</table>

Rows: 1
Nodes created: 1
Properties set: 2
Labels added: 1

10.2.8. randomUUID()

The function `randomUUID()` returns a randomly-generated Universally Unique Identifier (UUID), also known as a Globally Unique Identifier (GUID). This is a 128-bit value with strong guarantees of uniqueness.

Syntax: `randomUUID()`

Returns: A String.

Query

```sql
RETURN randomUUID() AS uuid
```

Table 263. Result

<table>
<thead>
<tr>
<th>uuid</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;f1f2d683-8091-4da6-82fb-6640023f8e6c&quot;</td>
</tr>
</tbody>
</table>

Rows: 1

A randomly-generated UUID is returned.
10.2.9. size()

The function `size()` returns the number of elements in a list.

**Syntax:** `size(list)`

**Returns:**

An Integer.

**Arguments:**

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>list</td>
<td>An expression that returns a list.</td>
</tr>
</tbody>
</table>

**Considerations:**

`size(null)` returns `null`.

**Query**

```
RETURN size(['Alice', 'Bob'])
```

**Table 264. Result**

<table>
<thead>
<tr>
<th>size(['Alice', 'Bob'])</th>
<th>2</th>
</tr>
</thead>
<tbody>
<tr>
<td>Rows: 1</td>
<td></td>
</tr>
</tbody>
</table>

The number of elements in the list is returned.

10.2.10. size() applied to pattern expression

This is the same function `size()` as described above, but you pass in a pattern expression, instead of a list. The function size will then calculate on a list of paths.

**Syntax:** `size(pattern expression)`

**Arguments:**

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>pattern expression</td>
<td>A pattern expression that returns a list.</td>
</tr>
</tbody>
</table>

**Query**

```
MATCH (a)
WHERE a.name = 'Alice'
RETURN size((a)--()--() AS fofof
```
Table 265. Result

<table>
<thead>
<tr>
<th>fof</th>
<th>3</th>
</tr>
</thead>
<tbody>
<tr>
<td>Rows: 1</td>
<td></td>
</tr>
</tbody>
</table>

The number of paths matching the pattern expression is returned. (The size of the list of paths).

10.2.11. size() applied to string

The function `size()` returns the number of Unicode characters in a string.

Syntax: `size(string)`

Returns:

An Integer.

Arguments:

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>string</td>
<td>An expression that returns a string value.</td>
</tr>
</tbody>
</table>

Considerations:

`size(null)` returns null.

Query

```sql
MATCH (a)
WHERE size(a.name) > 6
RETURN size(a.name)
```

Table 266. Result

<table>
<thead>
<tr>
<th>size(a.name)</th>
<th>7</th>
</tr>
</thead>
<tbody>
<tr>
<td>Rows: 1</td>
<td></td>
</tr>
</tbody>
</table>

The number of characters in the string 'Charlie' is returned.

10.2.12. startNode()

The function `startNode()` returns the start node of a relationship.

Syntax: `startNode(relationship)`

Returns:
A Node.

Arguments:

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>relationship</td>
<td>An expression that returns a relationship.</td>
</tr>
</tbody>
</table>

Considerations:

- `startNode(null)` returns `null`.

Query

```
MATCH (x:Developer)-[r]-()
RETURN startNode(r)
```

Table 267. Result

<table>
<thead>
<tr>
<th>startNode(r)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Node[0]{name:&quot;Alice&quot;,age:38,eyes:&quot;brown&quot;}</td>
</tr>
<tr>
<td>Node[0]{name:&quot;Alice&quot;,age:38,eyes:&quot;brown&quot;}</td>
</tr>
</tbody>
</table>

Rows: 2

10.2.13. `timestamp()`

The function `timestamp()` returns the difference, measured in milliseconds, between the current time and midnight, January 1, 1970 UTC.

- It is the equivalent of `datetime().epochMillis`.

Syntax: `timestamp()`

Returns:

An Integer.

Considerations:

- `timestamp()` will return the same value during one entire query, even for long-running queries.

Query

```
RETURN timestamp()
```

The time in milliseconds is returned.

Table 268. Result
10.2.14. toBoolean()

The function toBoolean() converts a string, integer or boolean value to a boolean value.

Syntax: toBoolean(expression)

Returns:

A Boolean.

Arguments:

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>expression</td>
<td>An expression that returns a boolean, string or integer value.</td>
</tr>
</tbody>
</table>

Considerations:

toBoolean(null) returns null.

If expression is a boolean value, it will be returned unchanged.

If the parsing fails, null will be returned.

If expression is the integer value 0, false will be returned. For any other integer value true will be returned.

This function will return an error if provided with an expression that is not a string, integer or boolean value.

Query

```
RETURN toBoolean('true'), toBoolean('not a boolean'), toBoolean(0)
```

Table 269. Result

<table>
<thead>
<tr>
<th>toBoolean('true')</th>
<th>toBoolean('not a boolean')</th>
<th>toBoolean(0)</th>
</tr>
</thead>
<tbody>
<tr>
<td>true</td>
<td>&lt;null&gt;</td>
<td>false</td>
</tr>
</tbody>
</table>

Rows: 1

10.2.15. toBooleanOrNull()

The function toBooleanOrNull() converts a string, integer or boolean value to a boolean value. For any other input value, null will be returned.

Syntax: toBooleanOrNull(expression)

Returns:

null.
A Boolean or `null`.

**Arguments:**

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>expression</td>
<td>Any expression that returns a value.</td>
</tr>
</tbody>
</table>

**Considerations:**

```plaintext
toBooleanOrNull(null) returns null.
If expression is a boolean value, it will be returned unchanged.
If the parsing fails, `null` will be returned.
If expression is the integer value 0, `false` will be returned. For any other integer value `true` will be returned.
If the expression is not a string, integer or boolean value, `null` will be returned.
```

**Query**

```plaintext
RETURN toBooleanOrNull('true'), toBooleanOrNull('not a boolean'), toBooleanOrNull(0), toBooleanOrNull(1.5)
```

**Table 270. Result**

<table>
<thead>
<tr>
<th>toBooleanOrNull('true')</th>
<th>toBooleanOrNull('not a boolean')</th>
<th>toBooleanOrNull(0)</th>
<th>toBooleanOrNull(1.5)</th>
</tr>
</thead>
<tbody>
<tr>
<td>true</td>
<td>&lt;null&gt;</td>
<td>false</td>
<td>&lt;null&gt;</td>
</tr>
</tbody>
</table>

Rows: 1

### 10.2.16. toFloat()

The function `toFloat()` converts an integer, floating point or a string value to a floating point number.

**Syntax:** `toFloat(expression)`

**Returns:**

A Float.

**Arguments:**

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>expression</td>
<td>An expression that returns a numeric or a string value.</td>
</tr>
</tbody>
</table>

**Considerations:**

```
toFloat(null) returns null.
If expression is a floating point number, it will be returned unchanged.
```
If the parsing fails, null will be returned.

This function will return an error if provided with an expression that is not an integer, floating point or a string value.

Query

```
RETURN toFloat('11.5'), toFloat('not a number')
```

Table 271. Result

<table>
<thead>
<tr>
<th>toFloat('11.5')</th>
<th>toFloat('not a number')</th>
</tr>
</thead>
<tbody>
<tr>
<td>11.5</td>
<td>&lt;null&gt;</td>
</tr>
</tbody>
</table>

Rows: 1

10.2.17. toFloatOrNull()

The function toFloatOrNull() converts an integer, floating point or a string value to a floating point number. For any other input value, null will be returned.

Syntax: toFloatOrNull(expression)

Returns:

A Float or null.

Arguments:

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>expression</td>
<td>Any expression that returns a value.</td>
</tr>
</tbody>
</table>

Considerations:

toFloatOrNull(null) returns null.

If expression is a floating point number, it will be returned unchanged.

If the parsing fails, null will be returned.

If the expression is not an integer, floating point or a string value, null will be returned.

Query

```
RETURN toFloatOrNull('11.5'), toFloatOrNull('not a number'), toFloatOrNull(true)
```

Table 272. Result

<table>
<thead>
<tr>
<th>toFloatOrNull('11.5')</th>
<th>toFloatOrNull('not a number')</th>
<th>toFloatOrNull(true)</th>
</tr>
</thead>
<tbody>
<tr>
<td>11.5</td>
<td>&lt;null&gt;</td>
<td>&lt;null&gt;</td>
</tr>
</tbody>
</table>

Rows: 1
10.2.18. toInteger()

The function `toInteger()` converts a boolean, integer, floating point or a string value to an integer value.

Syntax: `toInteger(expression)`

Returns:

An Integer.

Arguments:

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>expression</code></td>
<td>An expression that returns a boolean, numeric or a string value.</td>
</tr>
</tbody>
</table>

Considerations:

- `toInteger(null)` returns `null`.
- If `expression` is an integer value, it will be returned unchanged.
- If the parsing fails, `null` will be returned.
- If `expression` is the boolean value `false`, `0` will be returned. If `expression` is the boolean value `true`, `1` will be returned.
- This function will return an error if provided with an expression that is not a boolean, floating point, integer or a string value.

Query

```sql
RETURN toInteger('42'), toInteger('not a number'), toInteger(true)
```

Table 273. Result

<table>
<thead>
<tr>
<th>toInteger('42')</th>
<th>toInteger('not a number')</th>
<th>toInteger(true)</th>
</tr>
</thead>
<tbody>
<tr>
<td>42</td>
<td>&lt;null&gt;</td>
<td>1</td>
</tr>
</tbody>
</table>

Rows: 1

10.2.19. toIntegerOrNull()

The function `toIntegerOrNull()` converts a boolean, integer, floating point or a string value to an integer value. For any other input value, `null` will be returned.

Syntax: `toIntegerOrNull(expression)`

Returns:

An Integer or `null`.

Arguments:
### expression

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>expression</td>
<td>Any expression that returns a value.</td>
</tr>
</tbody>
</table>

#### Considerations:

- `toIntegerOrNull(null)` returns `null`.
- If `expression` is an integer value, it will be returned unchanged.
- If the parsing fails, `null` will be returned.
- If `expression` is the boolean value `false`, `0` will be returned. If `expression` is the boolean value `true`, `1` will be returned.
- If the `expression` is not a boolean, floating point, integer or a string value, `null` will be returned.

#### Query

```sql
RETURN toIntegerOrNull('42'), toIntegerOrNull('not a number'), toIntegerOrNull(true), toIntegerOrNull(['A', 'B', 'C'])
```

#### Table 274. Result

<p>| | | | |</p>
<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>toIntegerOrNull('42')</td>
<td>toIntegerOrNull('not a number')</td>
<td>toIntegerOrNull(true)</td>
<td>toIntegerOrNull(['A', 'B', 'C'])</td>
</tr>
<tr>
<td>42</td>
<td>&lt;null&gt;</td>
<td>1</td>
<td>&lt;null&gt;</td>
</tr>
</tbody>
</table>

Rows: 1

### 10.2.20. type()

The function `type()` returns the string representation of the relationship type.

**Syntax:** `type(relationship)`

**Returns:**

A String.

**Arguments:**

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>relationship</td>
<td>An expression that returns a relationship.</td>
</tr>
</tbody>
</table>

#### Considerations:

- `type(null)` returns `null`.

#### Query

```sql
MATCH (n)-[r]->() WHERE n.name = 'Alice' RETURN type(r)
```
The relationship type of \( r \) is returned.

### Table 275. Result

<table>
<thead>
<tr>
<th>type(r)</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;KNOWS&quot;</td>
<td></td>
</tr>
<tr>
<td>&quot;KNOWS&quot;</td>
<td></td>
</tr>
</tbody>
</table>

Rows: 2

### 10.3. Aggregating functions

Aggregating functions take a set of values and calculate an aggregated value over them.

**Functions:**

- `avg()` - Numeric values
- `avg()` - Durations
- `collect()`
- `count()`
- `max()`
- `min()`
- `percentileCont()`
- `percentileDisc()`
- `stDev()`
- `stDevP()`
- `sum()` - Numeric values
- `sum()` - Durations

Aggregation can be computed over all the matching paths, or it can be further divided by introducing grouping keys. Grouping keys are non-aggregate expressions, that are used to group the values going into the aggregate functions.

Assume we have the following return statement:

```
RETURN n, count(*)
```

We have two return expressions: \( n \) and `count(*)`. The first, \( n \), is not an aggregate function, so it will be the grouping key. The latter, `count(*)` is an aggregate expression. The matching paths will be divided into different buckets, depending on the grouping key. The aggregate function will then be run on these buckets, calculating an aggregate value per bucket.

To use aggregations to sort the result set, the aggregation must be included in the `RETURN` to be used in the `ORDER BY`. 
The `DISTINCT` operator works in conjunction with aggregation. It is used to make all values unique before running them through an aggregate function. More information about `DISTINCT` may be found in Syntax → Aggregation operators.

The following graph is used for the examples below:

![Graph](image)

**10.3.1. avg() - Numeric values**

The function `avg()` returns the average of a set of numeric values.

**Syntax:** `avg(expression)`

**Returns:**

Either an Integer or a Float, depending on the values returned by `expression` and whether or not the calculation overflows.

**Arguments:**

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>expression</code></td>
<td>An expression returning a set of numeric values.</td>
</tr>
</tbody>
</table>

**Considerations:**

Any `null` values are excluded from the calculation.

`avg(null)` returns `null`.

**Query**

```
MATCH (n:Person)
RETURN avg(n.age)
```

The average of all the values in the property `age` is returned.

**Table 276. Result**

<table>
<thead>
<tr>
<th><code>avg(n.age)</code></th>
</tr>
</thead>
<tbody>
<tr>
<td>30.0</td>
</tr>
</tbody>
</table>
10.3.2. avg() - Durations

The function `avg()` returns the average of a set of Durations.

Syntax: `avg(expression)`

Returns:

A Duration.

Arguments:

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>expression</td>
<td>An expression returning a set of Durations.</td>
</tr>
</tbody>
</table>

Considerations:

Any `null` values are excluded from the calculation.

`avg(null)` returns `null`.

Query

```sql
UNWIND [duration('P2DT3H'), duration('PT1H45S')] AS dur
RETURN avg(dur)
```

The average of the two supplied Durations is returned.

Table 277. Result

<table>
<thead>
<tr>
<th>avg(dur)</th>
<th>P1DT2H22.5S</th>
</tr>
</thead>
</table>

Rows: 1

10.3.3. collect()

The function `collect()` returns a single aggregated list containing the values returned by an expression.

Syntax: `collect(expression)`

Returns:

A list containing heterogeneous elements; the types of the elements are determined by the values returned by `expression`.

Arguments:
<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>expression</td>
<td>An expression returning a set of values.</td>
</tr>
</tbody>
</table>

**Considerations:**

Any null values are ignored and will not be added to the list.

`collect(null)` returns an empty list.

**Query**

```sql
MATCH (n:Person)
RETURN collect(n.age)
```

All the values are collected and returned in a single list.

**Table 278. Result**

<table>
<thead>
<tr>
<th>collect(n.age)</th>
</tr>
</thead>
<tbody>
<tr>
<td>[13, 33, 44]</td>
</tr>
</tbody>
</table>

Rows: 1

### 10.3.4. count()

The function `count()` returns the number of values or rows, and appears in two variants:

- `count(*)`
  - returns the number of matching rows.

- `count(expr)`
  - returns the number of non-null values returned by an expression.

**Syntax:** `count(expression)`

**Returns:**

An Integer.

**Arguments:**

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>expression</td>
<td>An expression.</td>
</tr>
</tbody>
</table>

**Considerations:**

- `count(*)` includes rows returning null.
- `count(expr)` ignores null values.
Using `count(*)` to return the number of nodes

The function `count(*)` can be used to return the number of nodes; for example, the number of nodes connected to some node `n`.

Query

```sql
MATCH (n { name: 'A'})-->(x)
RETURN labels(n), n.age, count(*)
```

The labels and `age` property of the start node `n` and the number of nodes related to `n` are returned.

Table 279. Result

<table>
<thead>
<tr>
<th>labels(n)</th>
<th>n.age</th>
<th>count(*)</th>
</tr>
</thead>
<tbody>
<tr>
<td>[&quot;Person&quot;]</td>
<td>13</td>
<td>4</td>
</tr>
</tbody>
</table>

Rows: 1

Using `count(*)` to group and count relationship types

The function `count(*)` can be used to group the type of matched relationships and return the number.

Query

```sql
MATCH (n { name: 'A'})-[r]->()
RETURN type(r), count(*)
```

The type of matched relationships are grouped and the group count are returned.

Table 280. Result

<table>
<thead>
<tr>
<th>type(r)</th>
<th>count(*)</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;KNOWS&quot;</td>
<td>3</td>
</tr>
<tr>
<td>&quot;READS&quot;</td>
<td>1</td>
</tr>
</tbody>
</table>

Rows: 2

Using `count(expression)` to return the number of values

Instead of simply returning the number of rows with `count(*)`, it may be more useful to return the actual number of values returned by an expression.

Query

```sql
MATCH (n { name: 'A'})-->(x)
RETURN count(x)
```

The number of nodes that are connected directly (one relationship) to the node, with the name 'A', is
Counting non-null values

The function `count(expression)` can be used to return the number of non-null values returned by the expression.

Query

```sql
MATCH (n:Person)
RETURN count(n.age)
```

The number of nodes with the label `Person` and a property `age` is returned. (If you want the sum, use `sum(n.age)`)

Table 282. Result

<table>
<thead>
<tr>
<th>count(n.age)</th>
<th>3</th>
</tr>
</thead>
<tbody>
<tr>
<td>Rows: 1</td>
<td></td>
</tr>
</tbody>
</table>

Counting with and without duplicates

In this example we are trying to find all our friends of friends, and count them:

- `count(DISTINCT friend_of_friend)`
  - Will only count a `friend_of_friend` once, as `DISTINCT` removes the duplicates.

- `count(friend_of_friend)`
  - Will consider the same `friend_of_friend` multiple times.

Query

```sql
MATCH (me:Person)-->(friend:Person)-->(friend_of_friend:Person)
WHERE me.name = 'A'
RETURN count(DISTINCT friend_of_friend), count(friend_of_friend)
```

Both B and C know D and thus D will get counted twice when not using `DISTINCT`.

Table 283. Result

<table>
<thead>
<tr>
<th>count(DISTINCT friend_of_friend)</th>
<th>count(friend_of_friend)</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>2</td>
</tr>
<tr>
<td>Rows: 1</td>
<td></td>
</tr>
</tbody>
</table>
10.3.5. max()

The function `max()` returns the maximum value in a set of values.

**Syntax:** `max(expression)`

**Returns:**

A property type, or a list, depending on the values returned by `expression`.

**Arguments:**

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>expression</td>
<td>An expression returning a set containing any combination of property types and lists thereof.</td>
</tr>
</tbody>
</table>

**Considerations:**

- Any null values are excluded from the calculation.
- In a mixed set, any numeric value is always considered to be higher than any string value, and any string value is always considered to be higher than any list.
- Lists are compared in dictionary order, i.e. list elements are compared pairwise in ascending order from the start of the list to the end.
- `max(null)` returns `null`.

**Query**

```
UNWIND [1, 'a', null, 0.2, 'b', '1', '99'] AS val
RETURN max(val)
```

The highest of all the values in the mixed set — in this case, the numeric value 1 — is returned.

```
The value '99' (a string), is considered to be a lower value than 1 (an integer), because '99' is a string.
```

**Table 284. Result**

<table>
<thead>
<tr>
<th>max(val)</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
</tr>
</tbody>
</table>

Rows: 1

**Query**

```
UNWIND [[1, 'a', 89], [1, 2]] AS val
RETURN max(val)
```

The highest of all the lists in the set — in this case, the list `[1, 2]` — is returned, as the number 2 is considered to be a higher value than the string 'a', even though the list `[1, 'a', 89]` contains more
elements.

Table 285. Result

<table>
<thead>
<tr>
<th>max(val)</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>[1, 2]</td>
<td></td>
</tr>
<tr>
<td>Rows: 1</td>
<td></td>
</tr>
</tbody>
</table>

Query

MATCH (n:Person)
RETURN max(n.age)

The highest of all the values in the property age is returned.

Table 286. Result

<table>
<thead>
<tr>
<th>max(n.age)</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>44</td>
<td></td>
</tr>
<tr>
<td>Rows: 1</td>
<td></td>
</tr>
</tbody>
</table>

10.3.6. min()

The function min() returns the minimum value in a set of values.

Syntax: min(expression)

Returns:

A property type, or a list, depending on the values returned by expression.

Arguments:

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>expression</td>
<td>An expression returning a set containing any combination of property types and lists thereof.</td>
</tr>
</tbody>
</table>

Considerations:

Any null values are excluded from the calculation.

In a mixed set, any string value is always considered to be lower than any numeric value, and any list is always considered to be lower than any string.

Lists are compared in dictionary order, i.e. list elements are compared pairwise in ascending order from the start of the list to the end.

min(null) returns null.
The lowest of all the values in the mixed set — in this case, the string value "1" — is returned. Note that the (numeric) value 0.2, which may appear at first glance to be the lowest value in the list, is considered to be a higher value than "1" as the latter is a string.

Table 287. Result

<table>
<thead>
<tr>
<th>min(val)</th>
<th>&quot;1&quot;</th>
</tr>
</thead>
<tbody>
<tr>
<td>Rows: 1</td>
<td></td>
</tr>
</tbody>
</table>

The lowest of all the values in the set — in this case, the list ['a', 'c', 23] — is returned, as (i) the two lists are considered to be lower values than the string "d", and (ii) the string "a" is considered to be a lower value than the numerical value 1.

Table 288. Result

<table>
<thead>
<tr>
<th>min(val)</th>
<th>[&quot;a&quot;,&quot;c&quot;,23]</th>
</tr>
</thead>
<tbody>
<tr>
<td>Rows: 1</td>
<td></td>
</tr>
</tbody>
</table>

The lowest of all the values in the property age is returned.

Table 289. Result

<table>
<thead>
<tr>
<th>min(n.age)</th>
<th>13</th>
</tr>
</thead>
<tbody>
<tr>
<td>Rows: 1</td>
<td></td>
</tr>
</tbody>
</table>

10.3.7. percentileCont()

The function percentileCont() returns the percentile of the given value over a group, with a percentile from 0.0 to 1.0. It uses a linear interpolation method, calculating a weighted average between two values if the desired percentile lies between them. For nearest values using a rounding method, see percentileDisc.
Syntax: `percentileCont(expression, percentile)`

Returns:

A Float.

Arguments:

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>expression</td>
<td>A numeric expression.</td>
</tr>
<tr>
<td>percentile</td>
<td>A numeric value between 0.0 and 1.0</td>
</tr>
</tbody>
</table>

Considerations:

Any null values are excluded from the calculation.

`percentileCont(null, percentile)` returns null.

Query

```
MATCH (n:Person)
RETURN percentileCont(n.age, 0.4)
```

The 40th percentile of the values in the property `age` is returned, calculated with a weighted average.

Table 290. Result

<table>
<thead>
<tr>
<th>percentileCont(n.age, 0.4)</th>
<th>29.0</th>
</tr>
</thead>
<tbody>
<tr>
<td>Rows:</td>
<td>1</td>
</tr>
</tbody>
</table>

10.3.8. `percentileDisc()`

The function `percentileDisc()` returns the percentile of the given value over a group, with a percentile from 0.0 to 1.0. It uses a rounding method and calculates the nearest value to the percentile. For interpolated values, see `percentileCont`.

Syntax: `percentileDisc(expression, percentile)`

Returns:

Either an Integer or a Float, depending on the values returned by `expression` and whether or not the calculation overflows.

Arguments:

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>expression</td>
<td>A numeric expression.</td>
</tr>
<tr>
<td>percentile</td>
<td>A numeric value between 0.0 and 1.0</td>
</tr>
</tbody>
</table>
Considerations:

Any null values are excluded from the calculation.

percentileDisc(null, percentile) returns null.

Query

MATCH (n:Person)
RETURN percentileDisc(n.age, 0.5)

The 50th percentile of the values in the property age is returned.

Table 291. Result

<table>
<thead>
<tr>
<th>percentileDisc(n.age, 0.5)</th>
<th>33</th>
</tr>
</thead>
<tbody>
<tr>
<td>Rows: 1</td>
<td></td>
</tr>
</tbody>
</table>

10.3.9. stDev()

The function stDev() returns the standard deviation for the given value over a group. It uses a standard two-pass method, with \( N - 1 \) as the denominator, and should be used when taking a sample of the population for an unbiased estimate. When the standard variation of the entire population is being calculated, stdDevP should be used.

Syntax: stDev(expression)

Returns:

A Float.

Arguments:

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>expression</td>
<td>A numeric expression.</td>
</tr>
</tbody>
</table>

Considerations:

Any null values are excluded from the calculation.

stDev(null) returns 0.

Query

MATCH (n)
WHERE n.name IN ['A', 'B', 'C']
RETURN stDev(n.age)

The standard deviation of the values in the property age is returned.
10.3.10. `stDevP()`

The function `stDevP()` returns the standard deviation for the given value over a group. It uses a standard two-pass method, with $N$ as the denominator, and should be used when calculating the standard deviation for an entire population. When the standard variation of only a sample of the population is being calculated, `stDev` should be used.

**Syntax:** `stDevP(expression)`

**Returns:**

A Float.

**Arguments:**

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>expression</td>
<td>A numeric expression.</td>
</tr>
</tbody>
</table>

**Considerations:**

Any null values are excluded from the calculation.

`stDevP(null)` returns 0.

**Query**

```
MATCH (n)
WHERE n.name IN ['A', 'B', 'C']
RETURN stDevP(n.age)
```

The population standard deviation of the values in the property `age` is returned.

**Table 293. Result**

<table>
<thead>
<tr>
<th>stDevP(n.age)</th>
<th>12.832251036613439</th>
</tr>
</thead>
<tbody>
<tr>
<td>Rows: 1</td>
<td></td>
</tr>
</tbody>
</table>

10.3.11. `sum()` - Numeric values

The function `sum()` returns the sum of a set of numeric values.

**Syntax:** `sum(expression)`
Returns:

Either an Integer or a Float, depending on the values returned by `expression`.

Arguments:

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>expression</code></td>
<td>An expression returning a set of numeric values.</td>
</tr>
</tbody>
</table>

Considerations:

Any `null` values are excluded from the calculation.

```
sum(null) returns 0.
```

Query

```graphql
MATCH (n:Person)
RETURN sum(n.age)
```

The sum of all the values in the property `age` is returned.

Table 294. Result

<table>
<thead>
<tr>
<th>sum(n.age)</th>
<th>90</th>
</tr>
</thead>
</table>

Rows: 1

10.3.12. sum() - Durations

The function `sum()` returns the sum of a set of durations.

**Syntax:** `sum(expression)`

**Returns:**  
A Duration.

Arguments:

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>expression</code></td>
<td>An expression returning a set of Durations.</td>
</tr>
</tbody>
</table>

Considerations:

Any `null` values are excluded from the calculation.
The sum of the two supplied Durations is returned.

<table>
<thead>
<tr>
<th>sum(dur)</th>
</tr>
</thead>
<tbody>
<tr>
<td>P2DT4H45S</td>
</tr>
</tbody>
</table>

Rows: 1

10.4. List functions

List functions return lists of things — nodes in a path, and so on.

Further details and examples of lists may be found in Lists and List operators.

Functions:

- `keys()`
- `labels()`
- `nodes()`
- `range()`
- `reduce()`
- `relationships()`
- `reverse()`
- `tail()`
- `toBooleanList()`
- `toFloatList()`
- `toIntegerList()`
- `toStringList()`
Graph

10.4.1. keys()

keys returns a list containing the string representations for all the property names of a node, relationship, or map.

Syntax: `keys(expression)`

Returns:

A list containing String elements.

Arguments:

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>expression</td>
<td>An expression that returns a node, a relationship, or a map.</td>
</tr>
</tbody>
</table>

Considerations:

keys(null) returns null.

Query

```
MATCH (a) WHERE a.name = 'Alice'
RETURN keys(a)
```

A list containing the names of all the properties on the node bound to `a` is returned.

Table 296. Result

<table>
<thead>
<tr>
<th>keys(a)</th>
</tr>
</thead>
<tbody>
<tr>
<td>[&quot;name&quot;,&quot;age&quot;,&quot;eyes&quot;]</td>
</tr>
</tbody>
</table>

Rows: 1
10.4.2. labels()

labels returns a list containing the string representations for all the labels of a node.

Syntax: labels(node)

Returns:

- A list containing String elements.

Arguments:

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>node</td>
<td>An expression that returns a single node.</td>
</tr>
</tbody>
</table>

Considerations:

labels(null) returns null.

Query

```
MATCH (a)
WHERE a.name = 'Alice'
RETURN labels(a)
```

A list containing all the labels of the node bound to a is returned.

Table 297. Result

<table>
<thead>
<tr>
<th>labels(a)</th>
</tr>
</thead>
<tbody>
<tr>
<td>[&quot;Person&quot;,&quot;Developer&quot;]</td>
</tr>
</tbody>
</table>

Rows: 1

10.4.3. nodes()

nodes() returns a list containing all the nodes in a path.

Syntax: nodes(path)

Returns:

- A list containing Node elements.

Arguments:

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>path</td>
<td>An expression that returns a path.</td>
</tr>
</tbody>
</table>

Considerations:
nodes(null) returns null.

Query

```
MATCH p = (a)-->(b)-->(c)
WHERE a.name = 'Alice' AND c.name = 'Eskil'
RETURN nodes(p)
```

A list containing all the nodes in the path p is returned.

Table 298. Result

<table>
<thead>
<tr>
<th>nodes(p)</th>
</tr>
</thead>
<tbody>
<tr>
<td>[Node[0]{name:&quot;Alice&quot;,age:38,eyes:&quot;brown&quot;},Node[1]{name:&quot;Bob&quot;,age:25,eyes:&quot;blue&quot;},Node[4]{eyes:&quot;blue&quot;,array:[&quot;one&quot;,&quot;two&quot;,&quot;three&quot;],name:&quot;Eskil&quot;,age:41}]</td>
</tr>
<tr>
<td>Rows: 1</td>
</tr>
</tbody>
</table>

10.4.4. range()

range() returns a list comprising all integer values within a range bounded by a start value start and end value end, where the difference step between any two consecutive values is constant; i.e. an arithmetic progression. To create ranges with decreasing integer values, use a negative value step. The range is inclusive for non-empty ranges, and the arithmetic progression will therefore always contain start and — depending on the values of start, step and end — end. The only exception where the range does not contain start are empty ranges. An empty range will be returned if the value step is negative and start - end is positive, or vice versa, e.g. range(0, 5, -1).

Syntax: range(start, end [, step])

Returns:

A list of Integer elements.

Arguments:

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>start</td>
<td>An expression that returns an integer value.</td>
</tr>
<tr>
<td>end</td>
<td>An expression that returns an integer value.</td>
</tr>
<tr>
<td>step</td>
<td>A numeric expression defining the difference between any two consecutive values, with a default of 1.</td>
</tr>
</tbody>
</table>

Query

```
RETURN range(0, 10), range(2, 18, 3), range(0, 5, -1)
```

Three lists of numbers in the given ranges are returned.

Table 299. Result
10.4.5. reduce()

reduce() returns the value resulting from the application of an expression on each successive element in a list in conjunction with the result of the computation thus far. This function will iterate through each element \( e \) in the given list, run the expression on \( e \) — taking into account the current partial result — and store the new partial result in the accumulator. This function is analogous to the \texttt{fold} or \texttt{reduce} method in functional languages such as Lisp and Scala.

Syntax: \texttt{reduce(accumulator = initial, variable IN list \mid expression)}

Returns:

The type of the value returned depends on the arguments provided, along with the semantics of \texttt{expression}.

Arguments:

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>accumulator</td>
<td>A variable that will hold the result and the partial results as the list is iterated.</td>
</tr>
<tr>
<td>initial</td>
<td>An expression that runs once to give a starting value to the accumulator.</td>
</tr>
<tr>
<td>list</td>
<td>An expression that returns a list.</td>
</tr>
<tr>
<td>variable</td>
<td>The closure will have a variable introduced in its context. We decide here which variable to use.</td>
</tr>
<tr>
<td>expression</td>
<td>This expression will run once per value in the list, and produce the result value.</td>
</tr>
</tbody>
</table>

Query

```
MATCH p = (a)-->>(b)-->>(c)
WHERE a.name = 'Alice' AND b.name = 'Bob' AND c.name = 'Daniel'
RETURN reduce(totalAge = 0, n IN nodes(p) \mid totalAge + n.age) AS reduction
```

The \texttt{age} property of all nodes in the path are summed and returned as a single value.

Table 300. Result

<table>
<thead>
<tr>
<th>reduction</th>
<th>117</th>
</tr>
</thead>
<tbody>
<tr>
<td>Rows: 1</td>
<td></td>
</tr>
</tbody>
</table>
10.4.6. relationships()

relationships() returns a list containing all the relationships in a path.

Syntax: relationships(path)

Returns:

A list containing Relationship elements.

Arguments:

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>path</td>
<td>An expression that returns a path.</td>
</tr>
</tbody>
</table>

Considerations:

relationships(null) returns null.

Query

MATCH p = (a)-->(b)-->(c)
WHERE a.name = 'Alice' AND c.name = 'Eskil'
RETURN relationships(p)

A list containing all the relationships in the path p is returned.

Table 301. Result

<table>
<thead>
<tr>
<th>relationships(p)</th>
</tr>
</thead>
<tbody>
<tr>
<td>[:KNOWS[0]{},:MARRIED[4]{}]</td>
</tr>
</tbody>
</table>

Rows: 1

10.4.7. reverse()

reverse() returns a list in which the order of all elements in the original list have been reversed.

Syntax: reverse(original)

Returns:

A list containing homogeneous or heterogeneous elements; the types of the elements are determined by the elements within original.

Arguments:

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>original</td>
<td>An expression that returns a list.</td>
</tr>
</tbody>
</table>
Considerations:

Any null element in original is preserved.

Query

WITH [4923, 'abc', 521, null, 487] AS ids
RETURN reverse(ids)

Table 302. Result

reverse(ids)

[487, null, 521, "abc", 4923]

Rows: 1

10.4.8. tail()

tail() returns a list containing all the elements, excluding the first one, from a list list.

Syntax: tail(list)

Returns:

A list containing heterogeneous elements; the types of the elements are determined by the elements in list.

Arguments:

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>list</td>
<td>An expression that returns a list.</td>
</tr>
</tbody>
</table>

Query

MATCH (a) WHERE a.name = 'Eskil'
RETURN a.array, tail(a.array)

The property named array and a list comprising all but the first element of the array property are returned.

Table 303. Result

<table>
<thead>
<tr>
<th>a.array</th>
<th>tail(a.array)</th>
</tr>
</thead>
<tbody>
<tr>
<td>[&quot;one&quot;,&quot;two&quot;,&quot;three&quot;]</td>
<td>[&quot;two&quot;,&quot;three&quot;]</td>
</tr>
</tbody>
</table>

Rows: 1

10.4.9. toBooleanList()

toBooleanList() converts a list of values and returns a list of boolean values. If any values are not convertible to boolean they will be null in the list returned.

Syntax: toBooleanList(list)
Returns:

A list containing the converted elements; depending on the input value a converted value is either a boolean value or \texttt{null}.

Arguments:

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>list</td>
<td>An expression that returns a list.</td>
</tr>
</tbody>
</table>

Considerations:

Any \texttt{null} element in \texttt{list} is preserved.

Any boolean value in \texttt{list} is preserved.

If the \texttt{list} is \texttt{null}, \texttt{null} will be returned.

If the \texttt{list} is not a list, an error will be returned.

The conversion for each value in \texttt{list} is done according to the \texttt{toBooleanOrNull()} function.

Query

\begin{verbatim}
RETURN toBooleanList(null) as noList, toBooleanList([null, null]) as nullsInList, toBooleanList(['a string', true, 'false', null, ['A', 'B']]) as mixedList
\end{verbatim}

Table 304. Result

<table>
<thead>
<tr>
<th>noList</th>
<th>nullsInList</th>
<th>mixedList</th>
</tr>
</thead>
<tbody>
<tr>
<td>\texttt{null}</td>
<td>\texttt{[null,null]}</td>
<td>\texttt{[null,true,false,null,null]}</td>
</tr>
</tbody>
</table>

Rows: 1

10.4.10. \texttt{toFloatList()}

\texttt{toFloatList()} converts a list of values and returns a list of floating point values. If any values are not convertible to floating point they will be \texttt{null} in the list returned.

Syntax: \texttt{toFloatList(list)}

Returns:

A list containing the converted elements; depending on the input value a converted value is either a floating point value or \texttt{null}.

Arguments:

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>list</td>
<td>An expression that returns a list.</td>
</tr>
</tbody>
</table>
Considerations:

- Any null element in \texttt{list} is preserved.
- Any floating point value in \texttt{list} is preserved.
- If the \texttt{list} is \texttt{null}, \texttt{null} will be returned.
- If the \texttt{list} is not a list, an error will be returned.
- The conversion for each value in \texttt{list} is done according to the \texttt{toFloatOrNull()} function.

Query

\begin{verbatim}
RETURN toFloatList(null) as noList,
toFloatList([null, null]) as nullsInList,
toFloatList(['a string', 2.5, '3.14159', null, ['A', 'B']]) as mixedList
\end{verbatim}

Table 305. Result

<table>
<thead>
<tr>
<th>noList</th>
<th>nullsInList</th>
<th>mixedList</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;null&gt;</td>
<td>[&lt;null&gt;, &lt;null&gt;]</td>
<td>[&lt;null&gt;, 2.5, 3.14159, &lt;null&gt;, &lt;null&gt;]</td>
</tr>
</tbody>
</table>

Rows: 1

10.4.11. toIntegerList()

toIntegerList() converts a list of values and returns a list of integer values. If any values are not convertible to integer they will be \texttt{null} in the list returned.

Syntax: toIntegerList(list)

Returns:

A list containing the converted elements; depending on the input value a converted value is either a integer value or \texttt{null}.

Arguments:

\begin{verbatim}
<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>list</td>
<td>An expression that returns a list.</td>
</tr>
</tbody>
</table>
\end{verbatim}

Considerations:

- Any null element in \texttt{list} is preserved.
- Any integer value in \texttt{list} is preserved.
- If the \texttt{list} is \texttt{null}, \texttt{null} will be returned.
- If the \texttt{list} is not a list, an error will be returned.
- The conversion for each value in \texttt{list} is done according to the \texttt{toIntegerOrNull()} function.
#### 10.4.12. toStringList()  

`toStringList()` converts a list of values and returns a list of string values. If any values are not convertible to string they will be `null` in the list returned.

**Syntax:** `toStringList(list)`

**Returns:**

A list containing the converted elements; depending on the input value a converted value is either a string value or `null`.

**Arguments:**

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>list</code></td>
<td>An expression that returns a list.</td>
</tr>
</tbody>
</table>

**Considerations:**

- Any `null` element in `list` is preserved.
- Any string value in `list` is preserved.
- If the `list` is `null`, `null` will be returned.
- If the `list` is not a list, an error will be returned.
- The conversion for each value in `list` is done according to the `toStringOrNull()` function.

**Query**

```sql
RETURN toStringList(null) as noList,
toStringList([null, null]) as nullsInList,
toStringList(['already a string', 2, '5', null, ['A','B']]) as mixedList
```

**Table 307. Result**

<table>
<thead>
<tr>
<th>noList</th>
<th>nullsInList</th>
<th>mixedList</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;null&gt;</td>
<td>[&lt;null&gt;,&lt;null&gt;]</td>
<td>[&lt;null&gt;,2,5,&lt;null&gt;,&lt;null&gt;]</td>
</tr>
</tbody>
</table>

Rows: 1
10.5. Mathematical functions - numeric

These functions all operate on numeric expressions only, and will return an error if used on any other values. See also Mathematical operators.

Functions:

- abs()
- ceil()
- floor()
- rand()
- round()
- round(), with precision
- round(), with precision and rounding mode
- sign()

The following graph is used for the examples below:

Graph

10.5.1. abs()

abs() returns the absolute value of the given number.

Syntax: abs(expression)

Returns:

The type of the value returned will be that of expression.

Arguments:
Considerations:

- abs(null) returns null.
- If expression is negative, -(expression) (i.e. the negation of expression) is returned.

Query

```
MATCH (a), (e) WHERE a.name = 'Alice' AND e.name = 'Eskil' RETURN a.age, e.age, abs(a.age - e.age)
```

The absolute value of the age difference is returned.

Table 308. Result

<table>
<thead>
<tr>
<th>a.age</th>
<th>e.age</th>
<th>abs(a.age - e.age)</th>
</tr>
</thead>
<tbody>
<tr>
<td>38</td>
<td>41</td>
<td>3</td>
</tr>
</tbody>
</table>

Rows: 1

10.5.2. ceil()

ceil() returns the smallest floating point number that is greater than or equal to the given number and equal to a mathematical integer.

Syntax: `ceil(expression)`

Returns:

A Float.

Arguments:

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>expression</td>
<td>A numeric expression.</td>
</tr>
</tbody>
</table>

Considerations:

- ceil(null) returns null.

Query

```
RETURN ceil(0.1)
```

The ceil of 0.1 is returned.

Table 309. Result
10.5.3. floor()

floor() returns the largest floating point number that is less than or equal to the given number and equal to a mathematical integer.

Syntax: floor(expression)

Returns:

A Float.

Arguments:

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>expression</td>
<td>A numeric expression.</td>
</tr>
</tbody>
</table>

Considerations:

floor(null) returns null.

Query

```
RETURN floor(0.9)
```

The floor of 0.9 is returned.

Table 310. Result

<table>
<thead>
<tr>
<th>floor(0.9)</th>
<th>0.0</th>
</tr>
</thead>
</table>

Rows: 1

10.5.4. rand()

rand() returns a random floating point number in the range from 0 (inclusive) to 1 (exclusive); i.e. \([0, 1)\).

The numbers returned follow an approximate uniform distribution.

Syntax: rand()

Returns:

A Float.
A random number is returned.

Table 311. Result

<table>
<thead>
<tr>
<th>rand()</th>
<th>0.6442238472026118</th>
</tr>
</thead>
<tbody>
<tr>
<td>Rows: 1</td>
<td></td>
</tr>
</tbody>
</table>

10.5.5. round()

`round()` returns the value of the given number rounded to the nearest integer, with half-way values always rounded up.

Syntax: `round(expression)`

Returns: A Float.

Arguments:

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>expression</td>
<td>A numeric expression to be rounded.</td>
</tr>
</tbody>
</table>

Considerations:

`round(null)` returns `null`.

Query

```
RETURN round(3.141592)
```

3.0 is returned.

Table 312. Result

<table>
<thead>
<tr>
<th>round(3.141592)</th>
<th>3.0</th>
</tr>
</thead>
<tbody>
<tr>
<td>Rows: 1</td>
<td></td>
</tr>
</tbody>
</table>

10.5.6. round(), with precision

`round()` returns the value of the given number rounded with the specified precision, with half-values always being rounded up.
Syntax: `round(expression, precision)`

Returns:

A Float.

Arguments:

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>expression</td>
<td>A numeric expression to be rounded.</td>
</tr>
<tr>
<td>precision</td>
<td>A numeric expression specifying precision.</td>
</tr>
</tbody>
</table>

Considerations:

`round(null)` returns null.

Query

```
RETURN round(3.141592, 3)
```

3.142 is returned.

Table 313. Result

<table>
<thead>
<tr>
<th>round(3.141592, 3)</th>
<th>3.142</th>
</tr>
</thead>
<tbody>
<tr>
<td>Rows: 1</td>
<td></td>
</tr>
</tbody>
</table>

10.5.7. `round()`, with precision and rounding mode

`round()` returns the value of the given number rounded with the specified precision and the specified rounding mode.

Syntax: `round(expression, precision, mode)`

Returns:

A Float.

Arguments:

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>expression</td>
<td>A numeric expression to be rounded.</td>
</tr>
<tr>
<td>precision</td>
<td>A numeric expression specifying precision.</td>
</tr>
<tr>
<td>mode</td>
<td>A string expression specifying rounding mode.</td>
</tr>
</tbody>
</table>
Modes:

<table>
<thead>
<tr>
<th>Mode</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CEILING</td>
<td>Round towards positive infinity.</td>
</tr>
<tr>
<td>DOWN</td>
<td>Round towards zero.</td>
</tr>
<tr>
<td>FLOOR</td>
<td>Round towards zero.</td>
</tr>
<tr>
<td>HALF_DOWN</td>
<td>Round towards closest value of given precision, with half-values always being rounded down.</td>
</tr>
<tr>
<td>HALF_EVEN</td>
<td>Round towards closest value of given precision, with half-values always being rounded to the even neighbor.</td>
</tr>
<tr>
<td>HALF_UP</td>
<td>Round towards closest value of given precision, with half-values always being rounded up.</td>
</tr>
<tr>
<td>UP</td>
<td>Round away from zero.</td>
</tr>
</tbody>
</table>

Considerations:

round(null) returns null.

Query

```
RETURN round(3.141592, 2, 'CEILING')
```

3.15 is returned.

Table 314. Result

<table>
<thead>
<tr>
<th>round(3.141592, 2, 'CEILING')</th>
<th>3.15</th>
</tr>
</thead>
<tbody>
<tr>
<td>Rows:</td>
<td>1</td>
</tr>
</tbody>
</table>

10.5.8. sign()

sign() returns the signum of the given number: 0 if the number is 0, -1 for any negative number, and 1 for any positive number.

Syntax: sign(expression)

Returns:

An Integer.

Arguments:

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>expression</td>
<td>A numeric expression.</td>
</tr>
</tbody>
</table>
Considerations:

\[ \text{sign(null)} \text{ returns null.} \]

Query

```sql
RETURN sign(-17), sign(0.1)
```

The signs of -17 and 0.1 are returned.

Table 315. Result

<table>
<thead>
<tr>
<th>sign(-17)</th>
<th>sign(0.1)</th>
</tr>
</thead>
<tbody>
<tr>
<td>-1</td>
<td>1</td>
</tr>
</tbody>
</table>

Rows: 1

10.6. Mathematical functions - logarithmic

These functions all operate on numeric expressions only, and will return an error if used on any other values. See also Mathematical operators.

Functions:

- `e()`
- `exp()`
- `log()`
- `log10()`
- `log10()`
- `sqrt()`

10.6.1. `e()`

\[ e() \text{ returns the base of the natural logarithm, } e. \]

Syntax: `e()`

Returns:

A Float.

Query

```sql
RETURN e()
```

The base of the natural logarithm, \(e\), is returned.

Table 316. Result
10.6.2. exp()

exp() returns $e^n$, where $e$ is the base of the natural logarithm, and $n$ is the value of the argument expression.

Syntax: `exp(expression)`

Returns:

A Float.

Arguments:

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>expression</td>
<td>A numeric expression.</td>
</tr>
</tbody>
</table>

Considerations:

exp(null) returns null.

Query

```
RETURN exp(2)
```

e to the power of 2 is returned.

Table 317. Result

<table>
<thead>
<tr>
<th>exp(2)</th>
<th>7.38905609893065</th>
</tr>
</thead>
<tbody>
<tr>
<td>Rows: 1</td>
<td></td>
</tr>
</tbody>
</table>

10.6.3. log()

log() returns the natural logarithm of a number.

Syntax: `log(expression)`

Returns:

A Float.

Arguments:
### log

**Expression:** A numeric expression.

**Considerations:**

- \( \log(null) \) returns null.
- \( \log(0) \) returns null.

**Query**

```sql
RETURN log(27)
```

The natural logarithm of 27 is returned.

**Table 318. Result**

<table>
<thead>
<tr>
<th>log(27)</th>
<th>3.295836866004329</th>
</tr>
</thead>
<tbody>
<tr>
<td>Rows:</td>
<td>1</td>
</tr>
</tbody>
</table>

#### 10.6.4. log10()

**log10()** returns the common logarithm (base 10) of a number.

**Syntax:** `log10(expression)`

**Returns:** A Float.

**Arguments:**

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>expression</td>
<td>A numeric expression.</td>
</tr>
</tbody>
</table>

**Considerations:**

- \( \log10(null) \) returns null.
- \( \log10(0) \) returns null.

**Query**

```sql
RETURN log10(27)
```

The common logarithm of 27 is returned.

**Table 319. Result**
10.6.5. `sqrt()`

`sqrt()` returns the square root of a number.

**Syntax:** `sqrt(expression)`

**Returns:**

A Float.

**Arguments:**

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>expression</td>
<td>A numeric expression.</td>
</tr>
</tbody>
</table>

**Considerations:**

`sqrt(null)` returns `null`.  
`sqrt(<any negative number>)` returns `null`

**Query**

```
RETURN `sqrt(256)`
```

The square root of 256 is returned.

**Table 320. Result**

<table>
<thead>
<tr>
<th><code>sqrt(256)</code></th>
<th>16.0</th>
</tr>
</thead>
<tbody>
<tr>
<td>Rows: 1</td>
<td></td>
</tr>
</tbody>
</table>

10.7. Mathematical functions - trigonometric

These functions all operate on numeric expressions only, and will return an error if used on any other values. See also *Mathematical operators*.

**Functions:**

- `acos()`  
- `asin()`
10.7.1. acos()

acos() returns the arccosine of a number in radians.

Syntax: acos(expression)

Returns:

A Float.

Arguments:

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>expression</td>
<td>A numeric expression that represents the angle in radians.</td>
</tr>
</tbody>
</table>

Considerations:

acos(null) returns null.

If (expression < -1) or (expression > 1), then (acos(expression)) returns null.

Query

```
RETURN acos(0.5)
```

The arccosine of 0.5 is returned.

Table 321. Result

<table>
<thead>
<tr>
<th>acos(0.5)</th>
<th>1.0471975511965979</th>
</tr>
</thead>
</table>

Rows: 1
10.7.2. asin()

asin() returns the arcsine of a number in radians.

Syntax: asin(expression)

Returns:
A Float.

Arguments:

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>expression</td>
<td>A numeric expression that represents the angle in radians.</td>
</tr>
</tbody>
</table>

Considerations:

asin(null) returns null.

If (expression < -1) or (expression > 1), then asin(expression) returns null.

Query

```
RETURN asin(0.5)
```

The arcsine of 0.5 is returned.

Table 322. Result

<table>
<thead>
<tr>
<th>asin(0.5)</th>
<th>0.5235987755982989</th>
</tr>
</thead>
<tbody>
<tr>
<td>Rows: 1</td>
<td></td>
</tr>
</tbody>
</table>

10.7.3. atan()

atan() returns the arctangent of a number in radians.

Syntax: atan(expression)

Returns:
A Float.

Arguments:

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>expression</td>
<td>A numeric expression that represents the angle in radians.</td>
</tr>
</tbody>
</table>
Considerations:

\( \text{atan}(\text{null}) \) returns \( \text{null} \).

Query

\[
\text{RETURN} \ \text{atan}(0.5)
\]

The arctangent of 0.5 is returned.

Table 323. Result

<table>
<thead>
<tr>
<th>atan(0.5)</th>
<th>0.4636476090008061</th>
</tr>
</thead>
<tbody>
<tr>
<td>Rows: 1</td>
<td></td>
</tr>
</tbody>
</table>

10.7.4. \texttt{atan2()} \n
\texttt{atan2()} returns the arctangent2 of a set of coordinates in radians.

Syntax: \texttt{atan2(expression1, expression2)}

Returns:

A Float.

Arguments:

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>expression1</td>
<td>A numeric expression for y that represents the angle in radians.</td>
</tr>
<tr>
<td>expression2</td>
<td>A numeric expression for x that represents the angle in radians.</td>
</tr>
</tbody>
</table>

Considerations:

\( \text{atan2(null, null)}, \text{atan2(null, expression2)} \) and \( \text{atan(expression1, null)} \) all return \( \text{null} \).

Query

\[
\text{RETURN} \ \text{atan2}(0.5, 0.6)
\]

The arctangent2 of 0.5 and 0.6 is returned.

Table 324. Result

<table>
<thead>
<tr>
<th>atan2(0.5, 0.6)</th>
<th>0.6947382761967033</th>
</tr>
</thead>
</table>
10.7.5. cos()

`cos()` returns the cosine of a number.

**Syntax:** `cos(expression)`

**Returns:**

A Float.

**Arguments:**

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>expression</td>
<td>A numeric expression that represents the angle in radians.</td>
</tr>
</tbody>
</table>

**Considerations:**

`cos(null)` returns `null`.

**Query**

```
RETURN cos(0.5)
```

The cosine of 0.5 is returned.

**Table 325. Result**

<table>
<thead>
<tr>
<th>cos(0.5)</th>
<th>0.8775825618903728</th>
</tr>
</thead>
<tbody>
<tr>
<td>Rows: 1</td>
<td></td>
</tr>
</tbody>
</table>

10.7.6. cot()

`cot()` returns the cotangent of a number.

**Syntax:** `cot(expression)`

**Returns:**

A Float.

**Arguments:**
### cot

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>expression</td>
<td>A numeric expression that represents the angle in radians.</td>
</tr>
</tbody>
</table>

#### Considerations

- \( \cot(\text{null}) \) returns \( \text{null} \).
- \( \cot(0) \) returns \( \text{null} \).

#### Query

```sql
RETURN \cot(0.5)
```

The cotangent of \( 0.5 \) is returned.

#### Table 326. Result

<table>
<thead>
<tr>
<th>cot(0.5)</th>
<th>1.830487721712452</th>
</tr>
</thead>
<tbody>
<tr>
<td>Rows:</td>
<td>1</td>
</tr>
</tbody>
</table>

### degrees()

degrees() converts radians to degrees.

#### Syntax

`degrees(expression)`

#### Returns

A Float.

#### Arguments

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>expression</td>
<td>A numeric expression that represents the angle in radians.</td>
</tr>
</tbody>
</table>

#### Considerations

- \( \text{degrees(null)} \) returns \( \text{null} \).

#### Query

```sql
RETURN \text{degrees}(3.14159)
```

The number of degrees in something close to \( \pi \) is returned.

#### Table 327. Result
10.7.8. haversin()

*haversin()* returns half the versine of a number.

**Syntax:** `haversin(expression)`

**Returns:**
A Float.

**Arguments:**

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>expression</td>
<td>A numeric expression that represents the angle in radians.</td>
</tr>
</tbody>
</table>

**Considerations:**

*haversin(null)* returns *null*.

**Query**

```
RETURN haversin(0.5)
```

The haversine of *0.5* is returned.

**Table 328. Result**

<table>
<thead>
<tr>
<th>haversin(0.5)</th>
</tr>
</thead>
<tbody>
<tr>
<td>0.06120871905481362</td>
</tr>
</tbody>
</table>

10.7.9. Spherical distance using the haversin() function

The *haversin()* function may be used to compute the distance on the surface of a sphere between two points (each given by their latitude and longitude). In this example the spherical distance (in km) between Berlin in Germany (at lat 52.5, lon 13.4) and San Mateo in California (at lat 37.5, lon -122.3) is calculated using an average earth radius of 6371 km.

**Query**

```
CREATE (ber:City {lat: 52.5, lon: 13.4}), (sm:City {lat: 37.5, lon: -122.3})
RETURN 2 * 6371 * asin(sqrt(haversin(radians(sm.lat - ber.lat))
+ cos(radians(sm.lat)) * cos(radians(ber.lat)) *
haversin(radians(sm.lon - ber.lon)))) AS dist
```
The estimated distance between 'Berlin' and 'San Mateo' is returned.

<table>
<thead>
<tr>
<th>Table 329. Result</th>
</tr>
</thead>
<tbody>
<tr>
<td>dist</td>
</tr>
<tr>
<td>9129.969740051658</td>
</tr>
</tbody>
</table>

Rows: 1
Nodes created: 2
Properties set: 4
Labels added: 2

10.7.10. pi()

pi() returns the mathematical constant $\pi$.

Syntax: $\pi()$

Returns:

A Float.

Query

```
RETURN pi()
```

The constant $\pi$ is returned.

<table>
<thead>
<tr>
<th>Table 330. Result</th>
</tr>
</thead>
<tbody>
<tr>
<td>pi()</td>
</tr>
<tr>
<td>3.141592653589793</td>
</tr>
</tbody>
</table>

Rows: 1

10.7.11. radians()

radians() converts degrees to radians.

Syntax: radians(expression)

Returns:

A Float.

Arguments:

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>expression</td>
<td>A numeric expression that represents the angle in degrees.</td>
</tr>
</tbody>
</table>
Considerations:

\[ \text{radians(null) returns null.} \]

Query

\[
\text{RETURN radians(180)}
\]

The number of radians in 180 degrees is returned (\pi).

Table 331. Result

<table>
<thead>
<tr>
<th>radians(180)</th>
</tr>
</thead>
<tbody>
<tr>
<td>3.141592653589793</td>
</tr>
</tbody>
</table>

Rows: 1

10.7.12. \text{sine(\text{\textit{}})}

\text{sine(\text{\textit{}})} returns the sine of a number.

Syntax: \text{sine(expression)}

Returns:

A Float.

Arguments:

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>expression</td>
<td>A numeric expression that represents the angle in radians.</td>
</tr>
</tbody>
</table>

Considerations:

\[ \text{sine(null) returns null.} \]

Query

\[
\text{RETURN sine(0.5)}
\]

The sine of 0.5 is returned.

Table 332. Result

<table>
<thead>
<tr>
<th>sine(0.5)</th>
</tr>
</thead>
<tbody>
<tr>
<td>0.479425538604203</td>
</tr>
</tbody>
</table>

Rows: 1
10.7.13. tan()

`tan()` returns the tangent of a number.

**Syntax:** `tan(expression)`

**Returns:** A Float.

**Arguments:**

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>expression</code></td>
<td>A numeric expression that represents the angle in radians.</td>
</tr>
</tbody>
</table>

**Considerations:**

`tan(null)` returns `null`.

**Query**

```sql
RETURN tan(0.5)
```

The tangent of `0.5` is returned.

**Table 333. Result**

<table>
<thead>
<tr>
<th><code>tan(0.5)</code></th>
</tr>
</thead>
<tbody>
<tr>
<td><code>0.5463024898437905</code></td>
</tr>
</tbody>
</table>

**Rows: 1**

10.8. String functions

These functions all operate on string expressions only, and will return an error if used on any other values. The exception to this rule is `toString()`, which also accepts numbers, booleans and temporal values (i.e. Date, Time, LocalTime, DateTime, LocalDateTime or Duration values).

Functions taking a string as input all operate on Unicode characters rather than on a standard `char[]`. For example, the `size()` function applied to any Unicode character will return 1, even if the character does not fit in the 16 bits of one `char`.

When `toString()` is applied to a temporal value, it returns a string representation suitable for parsing by the corresponding temporal functions. This string will therefore be formatted according to the ISO 8601 format.
See also String operators.

Functions:

- left()
- lTrim()
- replace()
- reverse()
- right()
- rTrim()
- split()
- substring()
- toLower()
- toString()
- toStringOrNull()
- toUpper()
- trim()

10.8.1. left()

left() returns a string containing the specified number of leftmost characters of the original string.

Syntax: left(original, length)

Returns:

A String.

Arguments:

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>original</td>
<td>An expression that returns a string.</td>
</tr>
<tr>
<td>n</td>
<td>An expression that returns a positive integer.</td>
</tr>
</tbody>
</table>

Considerations:

- left(null, length) and left(null, null) both return null
- left(original, null) will raise an error.
- If length is not a positive integer, an error is raised.
- If length exceeds the size of original, original is returned.
Returns: `lTrim('   hello')` returns "hello"

10.8.3. replace()

`replace()` returns a string in which all occurrences of a specified string in the original string have been replaced by another (specified) string.

Syntax: `replace(original, search, replace)`

Returns:
A String.

Arguments:

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>original</td>
<td>An expression that returns a string.</td>
</tr>
<tr>
<td>search</td>
<td>An expression that specifies the string to be replaced in original.</td>
</tr>
<tr>
<td>replace</td>
<td>An expression that specifies the replacement string.</td>
</tr>
</tbody>
</table>

Considerations:

If any argument is null, null will be returned.

If search is not found in original, original will be returned.

Query

```
RETURN replace("hello", "l", "w")
```

Table 336. Result

```
replace("hello", "l", "w")
"hewwo"
```

Rows: 1

10.8.4. reverse()

reverse() returns a string in which the order of all characters in the original string have been reversed.

Syntax: `reverse(original)`

Returns:

A String.

Arguments:

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>original</td>
<td>An expression that returns a string.</td>
</tr>
</tbody>
</table>

Considerations:

reverse(null) returns null.
Query

```
RETURN reverse('anagram')
```

Table 337. Result

<table>
<thead>
<tr>
<th>reverse('anagram')</th>
<th>&quot;margana&quot;</th>
</tr>
</thead>
<tbody>
<tr>
<td>Rows: 1</td>
<td></td>
</tr>
</tbody>
</table>

10.8.5. right()

right() returns a string containing the specified number of rightmost characters of the original string.

Syntax: `right(original, length)`

Returns:

A String.

Arguments:

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>original</td>
<td>An expression that returns a string.</td>
</tr>
<tr>
<td>n</td>
<td>An expression that returns a positive integer.</td>
</tr>
</tbody>
</table>

Considerations:

- `right(null, length)` and `right(null, null)` both return `null`
- `right(original, null)` will raise an error.
- If `length` is not a positive integer, an error is raised.
- If `length` exceeds the size of `original`, `original` is returned.

Query

```
RETURN right('hello', 3)
```

Table 338. Result

<table>
<thead>
<tr>
<th>right('hello', 3)</th>
<th>&quot;llo&quot;</th>
</tr>
</thead>
<tbody>
<tr>
<td>Rows: 1</td>
<td></td>
</tr>
</tbody>
</table>
10.8.6. rtrim()

*rTrim()* returns the original string with trailing whitespace removed.

**Syntax:** *rTrim(original)*

**Returns:**

A String.

**Arguments:**

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>original</td>
<td>An expression that returns a string.</td>
</tr>
</tbody>
</table>

**Considerations:**

*rTrim(null) returns null*

**Query**

```
RETURN rTrim('hello   ')
```

**Table 339. Result**

<table>
<thead>
<tr>
<th>rTrim('hello   ')</th>
<th><em>hello</em></th>
<th>Rows: 1</th>
</tr>
</thead>
</table>

10.8.7. split()

*split()* returns a list of strings resulting from the splitting of the original string around matches of the given delimiter.

**Syntax:** *split(original, splitDelimiter)*

**Returns:**

A list of Strings.

**Arguments:**

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>original</td>
<td>An expression that returns a string.</td>
</tr>
<tr>
<td>splitDelimiter</td>
<td>The string with which to split <em>original</em>.</td>
</tr>
</tbody>
</table>

**Considerations:**
split(null, splitDelimiter) and split(original, null) both return null

Query

```
RETURN split('one,two', ',')
```

Table 340. Result

<table>
<thead>
<tr>
<th>split('one,two', ',')</th>
<th>[&quot;one&quot;, &quot;two&quot;]</th>
</tr>
</thead>
<tbody>
<tr>
<td>Rows:</td>
<td>1</td>
</tr>
</tbody>
</table>

10.8.8. substring()

substring() returns a substring of the original string, beginning with a 0-based index start and length.

Syntax: `substring(original, start [, length])`

Returns:

A String.

Arguments:

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>original</td>
<td>An expression that returns a string.</td>
</tr>
<tr>
<td>start</td>
<td>An expression that returns a positive integer, denoting the position at which the substring will begin.</td>
</tr>
<tr>
<td>length</td>
<td>An expression that returns a positive integer, denoting how many characters of <code>original</code> will be returned.</td>
</tr>
</tbody>
</table>

Considerations:

- `start` uses a zero-based index.
- If `length` is omitted, the function returns the substring starting at the position given by `start` and extending to the end of `original`.
- If `original` is null, null is returned.
- If either `start` or `length` is null or a negative integer, an error is raised.
- If `start` is 0, the substring will start at the beginning of `original`.
- If `length` is 0, the empty string will be returned.

Query

```
RETURN substring('hello', 1, 3), substring('hello', 2)
```
Table 341. Result
<table>
<thead>
<tr>
<th>substring('hello', 1, 3)</th>
<th>substring('hello', 2)</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;ell&quot;</td>
<td>&quot;llo&quot;</td>
</tr>
</tbody>
</table>

Rows: 1

10.8.9. toLower()

toLower() returns the original string in lowercase.

Syntax: toLower(original)

Returns:

A String.

Arguments:

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>original</td>
<td>An expression that returns a string.</td>
</tr>
</tbody>
</table>

Considerations:

toLower(null) returns null

Query

```
RETURN toLower('HELLO')
```

Table 342. Result
<table>
<thead>
<tr>
<th>toLower('HELLO')</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;hello&quot;</td>
</tr>
</tbody>
</table>

Rows: 1

10.8.10. toString()

toString() converts an integer, float, boolean, string, point, duration, date, time, localtime, localdatetime or datetime value to a string.

Syntax: toString(expression)

Returns:

A String.

Arguments:
expression

An expression that returns a number, a boolean, string, temporal or spatial value.

Considerations:

<table>
<thead>
<tr>
<th>toString(null) returns null</th>
</tr>
</thead>
<tbody>
<tr>
<td>If expression is a string, it will be returned unchanged.</td>
</tr>
<tr>
<td>This function will return an error if provided with an expression that is not an integer, float, string, boolean, point, duration, date, time, localtime, localdatetime or datetime value.</td>
</tr>
</tbody>
</table>

Query

```sql
RETURN toString(11.5),
toString('already a string'),
toString(true),
toString(date({year: 1984, month: 10, day: 11})) AS dateString,
toString(datetime({year: 1984, month: 10, day: 11, hour: 12, minute: 31, second: 14, millisecond: 341, timezone: 'Europe/Stockholm'})) AS datetimeString,
toString(duration({minutes: 12, seconds: -60})) AS durationString
```

Table 343. Result

<table>
<thead>
<tr>
<th>toString(11.5)</th>
<th>toString('already a string')</th>
<th>toString(true)</th>
<th>dateString</th>
<th>datetimeString</th>
<th>durationString</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;11.5&quot;</td>
<td>&quot;already a string&quot;</td>
<td>&quot;true&quot;</td>
<td>&quot;1984-10-11&quot;</td>
<td>&quot;1984-10-11T12:31:14.341+01:00[Europe/Stockholm]&quot;</td>
<td>&quot;PT11M&quot;</td>
</tr>
</tbody>
</table>

Rows: 1

10.8.11. toStringOrNonNull()

The function `toStringOrNonNull()` converts an integer, float, boolean, string, point, duration, date, time, localtime, localdatetime or datetime value to a string.

Syntax: `toStringOrNonNull(expression)`

Returns:

A String or `null`.

Arguments:

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>expression</td>
<td>Any expression that returns a value.</td>
</tr>
</tbody>
</table>

Considerations:

<table>
<thead>
<tr>
<th>toStringOrNonNull(null) returns null</th>
</tr>
</thead>
</table>

If the `expression` is not an integer, float, string, boolean, point, duration, date, time, localtime, localdatetime or datetime value, `null` will be returned.

**Query**

```
RETURN toStringOrNull(11.5),
toStringOrNull('already a string'),
toStringOrNull(true),
toStringOrNull(date({year:1984, month:10, day:11})) AS dateString,
toStringOrNull(datetime({year:1984, month:10, day:11, hour:12, minute:31, second:14, millisecond: 341, timezone: 'Europe/Stockholm'})) AS dateTimeString,
toStringOrNull(duration({minutes: 12, seconds: -60})) AS durationString,
toStringOrNull(['A', 'B', 'C']) AS list
```

**Table 344. Result**

<table>
<thead>
<tr>
<th>toStringOrNull(11.5)</th>
<th>toStringOrNull('already a string')</th>
<th>toStringOrNull(true)</th>
<th>dateString</th>
<th>dateTimeString</th>
<th>durationString</th>
<th>list</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;11.5&quot;</td>
<td>&quot;already a string&quot;</td>
<td>&quot;true&quot;</td>
<td>&quot;1984-10-11&quot;</td>
<td>&quot;1984-10-11T12:31:14.341+01:00[Europe/Stockholm]&quot;</td>
<td>&quot;PT1H&quot;</td>
<td>&lt;null&gt;</td>
</tr>
</tbody>
</table>

Rows: 1

### 10.8.12. toUpper()

`toUpper()` returns the original string in uppercase.

**Syntax:** `toUpper(original)`

**Returns:**

A String.

**Arguments:**

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>original</td>
<td>An expression that returns a string.</td>
</tr>
</tbody>
</table>

**Considerations:**

`toUpper(null)` returns `null`

**Query**

```
RETURN toUpper('hello')
```

**Table 345. Result**

<table>
<thead>
<tr>
<th>toUpper('hello')</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;HELLO&quot;</td>
</tr>
</tbody>
</table>
10.8.13. trim()

trim() returns the original string with leading and trailing whitespace removed.

Syntax: trim(original)

Returns:

A String.

Arguments:

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>original</td>
<td>An expression that returns a string.</td>
</tr>
</tbody>
</table>

Considerations:

trim(null) returns null

Query

```cypher
RETURN trim(' hello ')
```

Table 346. Result

<table>
<thead>
<tr>
<th>trim(' hello ')</th>
<th>&quot;hello&quot;</th>
</tr>
</thead>
<tbody>
<tr>
<td>Rows: 1</td>
<td></td>
</tr>
</tbody>
</table>

10.9. Temporal functions - instant types

Cypher provides functions allowing for the creation and manipulation of values for each temporal type — Date, Time, LocalTime, DateTime, and LocalDateTime.

See also Temporal (Date/Time) values and Temporal operators.

10.9.1. Temporal instant types

An introduction to temporal instant types, including descriptions of creation functions, clocks, and truncation.
An overview of temporal instant type creation

Each function bears the same name as the type, and construct the type they correspond to in one of four ways:

- Capturing the current time
- Composing the components of the type
- Parsing a string representation of the temporal value
- Selecting and composing components from another temporal value by
  - either combining temporal values (such as combining a Date with a Time to create a DateTime), or
  - selecting parts from a temporal value (such as selecting the Date from a DateTime); the extractors — groups of components which can be selected — are:
    - date — contains all components for a Date (conceptually year, month and day).
    - time — contains all components for a Time (hour, minute, second, and sub-seconds; namely millisecond, microsecond and nanosecond). If the type being created and the type from which the time component is being selected both contain timezone (and a timezone is not explicitly specified) the timezone is also selected.
    - datetime — selects all components, and is useful for overriding specific components. Analogously to time, if the type being created and the type from which the time component is being selected both contain timezone (and a timezone is not explicitly specified) the timezone is also selected.
  - In effect, this allows for the conversion between different temporal types, and allowing for 'missing' components to be specified.

Table 347. Temporal instant type creation functions

<table>
<thead>
<tr>
<th>Function</th>

<td></td>
<td></td>
</tr>
</tbody>
</table>
Creating a value from other temporal values using extractors (i.e. converting between different types)

Creating a value from a string

Creating a value from a timestamp

Controlling which clock to use

The functions which create temporal instant values based on the current instant use the statement clock as default. However, there are three different clocks available for more fine-grained control:

- **transaction**: The same instant is produced for each invocation within the same transaction. A different time may be produced for different transactions.
- **statement**: The same instant is produced for each invocation within the same statement. A different time may be produced for different statements within the same transaction.
- **realtime**: The instant produced will be the live clock of the system.

The following table lists the different sub-functions for specifying the clock to be used when creating the current temporal instant value:

<table>
<thead>
<tr>
<th>Type</th>
<th>default</th>
<th>transaction</th>
<th>statement</th>
<th>realtime</th>
</tr>
</thead>
<tbody>
<tr>
<td>Date</td>
<td>date()</td>
<td>date.transaction()</td>
<td>date.statement()</td>
<td>date.realtime()</td>
</tr>
<tr>
<td>Time</td>
<td>time()</td>
<td>time.transaction()</td>
<td>time.statement()</td>
<td>time.realtime()</td>
</tr>
<tr>
<td>LocalTime</td>
<td>localtime()</td>
<td>localtime.transaction()</td>
<td>localtime.statement()</td>
<td>localtime.realtime()</td>
</tr>
<tr>
<td>DateTime</td>
<td>datetime()</td>
<td>datetime.transaction()</td>
<td>datetime.statement()</td>
<td>datetime.realtime()</td>
</tr>
<tr>
<td>LocalDateTime</td>
<td>localdatetime()</td>
<td>localdatetime.transaction()</td>
<td>localdatetime.statement()</td>
<td>localdatetime.realtime()</td>
</tr>
</tbody>
</table>

Truncating temporal values

A temporal instant value can be created by truncating another temporal instant value at the nearest preceding point in time at a specified component boundary (namely, a truncation unit). A temporal instant value
value created in this way will have all components which are less significant than the specified truncation unit set to their default values.

It is possible to supplement the truncated value by providing a map containing components which are less significant than the truncation unit. This will have the effect of overriding the default values which would otherwise have been set for these less significant components.

The following truncation units are supported:

- **millennium**: Select the temporal instant corresponding to the millenium of the given instant.
- **century**: Select the temporal instant corresponding to the century of the given instant.
- **decade**: Select the temporal instant corresponding to the decade of the given instant.
- **year**: Select the temporal instant corresponding to the year of the given instant.
- **weekYear**: Select the temporal instant corresponding to the first day of the first week of the week-year of the given instant.
- **quarter**: Select the temporal instant corresponding to the quarter of the year of the given instant.
- **month**: Select the temporal instant corresponding to the month of the given instant.
- **week**: Select the temporal instant corresponding to the week of the given instant.
- **day**: Select the temporal instant corresponding to the month of the given instant.
- **hour**: Select the temporal instant corresponding to the hour of the given instant.
- **minute**: Select the temporal instant corresponding to the minute of the given instant.
- **second**: Select the temporal instant corresponding to the second of the given instant.
- **millisecond**: Select the temporal instant corresponding to the millisecond of the given instant.
- **microsecond**: Select the temporal instant corresponding to the microsecond of the given instant.

The following table lists the supported truncation units and the corresponding sub-functions:

<table>
<thead>
<tr>
<th>Truncation unit</th>
<th>Date</th>
<th>Time</th>
<th>LocalTime</th>
<th>DateTime</th>
<th>LocalDateTime</th>
</tr>
</thead>
<tbody>
<tr>
<td>millennium</td>
<td>date.truncate('millennium', input)</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>century</td>
<td>date.truncate('century', input)</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>decade</td>

</tr>
<tr>
<td>microsecond</td>
<td></td>
<td>time.truncate('microsecond', input)</td>
<td>localtime.truncate('microsecond', input)</td>
<td>datetime.truncate('microsecond', input)</td>
<td>localdatetime.truncate('microsecond', input)</td>
</tr>
</tbody>
</table>

10.9.2. Date: **date()**

Details for using the **date()** function.

- Getting the current Date
- Creating a calendar (Year-Month-Day) Date
- Creating a week (Year-Week-Day) Date
- Creating a quarter (Year-Quarter-Day) Date
- Creating an ordinal (Year-Day) Date
- Creating a Date from a string
- Creating a Date using other temporal values as components
- Truncating a Date

Getting the current Date

date() returns the current Date value. If no time zone parameter is specified, the local time zone will be used.

**Syntax:** `date([timezone])`

**Returns:**
A Date.

Arguments:

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>A single map consisting of the following:</td>
<td></td>
</tr>
<tr>
<td>timezone</td>
<td>A string expression that represents the timezone</td>
</tr>
</tbody>
</table>

Considerations:

If no parameters are provided, \( \text{date()} \) must be invoked (\( \text{date()} \) is invalid).

Query

```
RETURN date() AS currentDate
```

The current date is returned.

Table 348. Result

<table>
<thead>
<tr>
<th>currentDate</th>
<th>2022-08-09</th>
</tr>
</thead>
<tbody>
<tr>
<td>Rows:</td>
<td>1</td>
</tr>
</tbody>
</table>

Query

```
RETURN date( {timezone: 'America/Los Angeles'} ) AS currentDateInLA
```

The current date in California is returned.

Table 349. Result

<table>
<thead>
<tr>
<th>currentDateInLA</th>
<th>2022-08-09</th>
</tr>
</thead>
<tbody>
<tr>
<td>Rows:</td>
<td>1</td>
</tr>
</tbody>
</table>

date.transaction()

date.transaction() returns the current Date value using the transaction clock. This value will be the same for each invocation within the same transaction. However, a different value may be produced for different transactions.

Syntax: \( \text{date.transaction([[-timezone]])} \)

Returns:

A Date.
Arguments:

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>timezone</td>
<td>A string expression that represents the time zone</td>
</tr>
</tbody>
</table>

Query

```
RETURN date.transaction() AS currentDate
```

Table 350. Result

<table>
<thead>
<tr>
<th>currentDate</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>2022-08-09</td>
</tr>
<tr>
<td>Rows: 1</td>
<td></td>
</tr>
</tbody>
</table>

`date.statement()`

date.statement() returns the current Date value using the statement clock. This value will be the same for each invocation within the same statement. However, a different value may be produced for different statements within the same transaction.

Syntax: `date.statement([{{timezone}}])`

Returns:

A Date.

Arguments:

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>timezone</td>
<td>A string expression that represents the time zone</td>
</tr>
</tbody>
</table>

Query

```
RETURN date.statement() AS currentDate
```

Table 351. Result

<table>
<thead>
<tr>
<th>currentDate</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>2022-08-09</td>
</tr>
<tr>
<td>Rows: 1</td>
<td></td>
</tr>
</tbody>
</table>

date.realtime()

date.realtime() returns the current Date value using the realtime clock. This value will be the live clock of
the system.

**Syntax:** `date.realtime([timezone])`

**Returns:**

A Date.

**Arguments:**

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>timezone</td>
<td>A string expression that represents the time zone</td>
</tr>
</tbody>
</table>

**Query**

```
RETURN date.realtime() AS currentDate
```

**Table 352. Result**

<table>
<thead>
<tr>
<th>currentDate</th>
<th>2022-08-09</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Rows:</strong></td>
<td>1</td>
</tr>
</tbody>
</table>

**Query**

```
RETURN date.realtime('America/Los Angeles') AS currentDateInLA
```

**Table 353. Result**

<table>
<thead>
<tr>
<th>currentDateInLA</th>
<th>2022-08-09</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Rows:</strong></td>
<td>1</td>
</tr>
</tbody>
</table>

**Creating a calendar (Year-Month-Day) Date**

`date()` returns a Date value with the specified year, month and day component values.

**Syntax:** `date([year [, month, day]])`

**Returns:**

A Date.

**Arguments:**

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>A single map consisting of the following:</td>
<td></td>
</tr>
<tr>
<td>Name</td>
<td>Description</td>
</tr>
<tr>
<td>-------</td>
<td>-------------</td>
</tr>
<tr>
<td>year</td>
<td>An expression consisting of at least four digits that specifies the year.</td>
</tr>
<tr>
<td>month</td>
<td>An integer between 1 and 12 that specifies the month.</td>
</tr>
<tr>
<td>day</td>
<td>An integer between 1 and 31 that specifies the day of the month.</td>
</tr>
</tbody>
</table>

**Considerations:**

The day of the month component will default to 1 if day is omitted.

The month component will default to 1 if month is omitted.

If month is omitted, day must also be omitted.

**Query**

```
UNWIND [date({year:1984, month:10, day:11}),
        date({year:1984, month:10}),
        date({year:1984})]
    as theDate
RETURN theDate
```

**Table 354. Result**

<table>
<thead>
<tr>
<th>theDate</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>1984-10-11</td>
<td></td>
</tr>
<tr>
<td>1984-10-01</td>
<td></td>
</tr>
<tr>
<td>1984-01-01</td>
<td></td>
</tr>
</tbody>
</table>

Rows: 3

**Creating a week (Year-Week-Day) Date**

`date()` returns a Date value with the specified year, week and dayOfWeek component values.

**Syntax:** `date({year [, week, dayOfWeek]})`

**Returns:**

A Date.

**Arguments:**

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>A single map consisting of the following:</td>
<td></td>
</tr>
<tr>
<td>year</td>
<td>An expression consisting of at least four digits that specifies the year.</td>
</tr>
<tr>
<td>Name</td>
<td>Description</td>
</tr>
<tr>
<td>------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>week</td>
<td>An integer between 1 and 53 that specifies the week.</td>
</tr>
<tr>
<td>dayOfWeek</td>
<td>An integer between 1 and 7 that specifies the day of the week.</td>
</tr>
</tbody>
</table>

**Considerations:**

- The day of the week component will default to 1 if `dayOfWeek` is omitted.
- The week component will default to 1 if `week` is omitted.
- If `week` is omitted, `dayOfWeek` must also be omitted.

**Query**

```plaintext
UNWIND [
  date({year: 1984, week: 10, dayOfWeek: 3}),
  date({year: 1984, week: 10}),
  date({year: 1984})
] as theDate
RETURN theDate
```

**Table 355. Result**

<table>
<thead>
<tr>
<th>theDate</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>1984-03-07</td>
<td></td>
</tr>
<tr>
<td>1984-03-05</td>
<td></td>
</tr>
<tr>
<td>1984-01-01</td>
<td></td>
</tr>
</tbody>
</table>

Rows: 3

**Creating a quarter (Year-Quarter-Day) Date**

`date()` returns a Date value with the specified year, quarter and `dayOfQuarter` component values.

**Syntax:** `date({year [, quarter, dayOfQuarter]})`

**Returns:**

A Date.

**Arguments:**

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>A single map consisting of the following:</strong></td>
<td></td>
</tr>
<tr>
<td>year</td>
<td>An expression consisting of at least four digits that specifies the year.</td>
</tr>
<tr>
<td>quarter</td>
<td>An integer between 1 and 4 that specifies the quarter.</td>
</tr>
</tbody>
</table>
### dayOfQuarter

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>dayOfQuarter</td>
<td>An integer between 1 and 92 that specifies the day of the quarter.</td>
</tr>
</tbody>
</table>

**Considerations:**

- The day of the quarter component will default to 1 if `dayOfQuarter` is omitted.
- The quarter component will default to 1 if `quarter` is omitted.
- If `quarter` is omitted, `dayOfQuarter` must also be omitted.

**Query**

```plaintext
UNWIND [
    date({year:1984, quarter:3, dayOfQuarter:45}),
    date({year:1984, quarter:3}),
    date({year:1984})
] as theDate
RETURN theDate
```

**Table 356. Result**

<table>
<thead>
<tr>
<th>theDate</th>
</tr>
</thead>
<tbody>
<tr>
<td>1984-08-14</td>
</tr>
<tr>
<td>1984-07-01</td>
</tr>
<tr>
<td>1984-01-01</td>
</tr>
<tr>
<td></td>
</tr>
<tr>
<td><strong>Rows:</strong> 3</td>
</tr>
</tbody>
</table>

**Creating an ordinal (Year-Day) Date**

`date()` returns a Date value with the specified year and `ordinalDay` component values.

**Syntax:** `date({year [, ordinalDay]})`

**Returns:**

A Date.

**Arguments:**

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>A single map consisting of the following:</td>
<td></td>
</tr>
<tr>
<td>year</td>
<td>An expression consisting of at least four digits that specifies the year.</td>
</tr>
<tr>
<td>ordinalDay</td>
<td>An integer between 1 and 366 that specifies the ordinal day of the year.</td>
</tr>
</tbody>
</table>

**Considerations:**
The ordinal day of the year component will default to 1 if `ordinalDay` is omitted.

Query
```
UNWIND [
    date({year:1984, ordinalDay:202}),
    date({year:1984})
] as theDate
RETURN theDate
```

The date corresponding to 11 February 1984 is returned.

Table 357. Result
<table>
<thead>
<tr>
<th>theDate</th>
</tr>
</thead>
<tbody>
<tr>
<td>1984-07-20</td>
</tr>
<tr>
<td>1984-01-01</td>
</tr>
</tbody>
</table>

Creating a Date from a string

`date()` returns the Date value obtained by parsing a string representation of a temporal value.

Syntax: `date(temporalValue)`

Returns:

A Date.

Arguments:

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>temporalValue</td>
<td>A string representing a temporal value.</td>
</tr>
</tbody>
</table>

Considerations:

- `temporalValue` must comply with the format defined for dates.
- `temporalValue` must denote a valid date; i.e. a `temporalValue` denoting 30 February 2001 is invalid.
- `date(null)` returns null.

Query
```
UNWIND [
    date('2015-07-21'),
    date('2015-07'),
    date('201507'),
    date('2015-W30-2'),
    date('2015W302'),
    date('2015202'),
    date('2015')
] as theDate
RETURN theDate
```
Creating a Date using other temporal values as components

date() returns the Date value obtained by selecting and composing components from another temporal value. In essence, this allows a DateTime or LocalDateTime value to be converted to a Date, and for "missing" components to be provided.

Syntax: date({date [, year, month, day, week, dayOfWeek, quarter, dayOfQuarter, ordinalDay]})

Returns:

A Date.

Arguments:

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>date</td>
<td>A Date value.</td>
</tr>
<tr>
<td>year</td>
<td>An expression consisting of at least four digits that specifies the year.</td>
</tr>
<tr>
<td>month</td>
<td>An integer between 1 and 12 that specifies the month.</td>
</tr>
<tr>
<td>day</td>
<td>An integer between 1 and 31 that specifies the day of the month.</td>
</tr>
<tr>
<td>week</td>
<td>An integer between 1 and 53 that specifies the week.</td>
</tr>
<tr>
<td>dayOfWeek</td>
<td>An integer between 1 and 7 that specifies the day of the week.</td>
</tr>
<tr>
<td>quarter</td>
<td>An integer between 1 and 4 that specifies the quarter.</td>
</tr>
<tr>
<td>dayOfQuarter</td>
<td>An integer between 1 and 92 that specifies the day of the quarter.</td>
</tr>
<tr>
<td>ordinalDay</td>
<td>An integer between 1 and 366 that specifies the ordinal day of the year.</td>
</tr>
</tbody>
</table>

Considerations:
If any of the optional parameters are provided, these will override the corresponding components of `date`.

date(dd) may be written instead of date({date: dd}).

Query

```
UNWIND [
  date({year: 1984, month: 11, day: 11}),
  localdatetime({year: 1984, month: 11, day: 11, hour: 12, minute: 31, second: 14}),
  datetime({year: 1984, month: 11, day: 11, hour: 12, timezone: '+01:00'})
] as dd
RETURN date({date: dd}) AS dateOnly,
    date({date: dd, day: 28}) AS dateDay
```

Table 359. Result

<table>
<thead>
<tr>
<th>dateOnly</th>
<th>dateDay</th>
</tr>
</thead>
<tbody>
<tr>
<td>1984-11-11</td>
<td>1984-11-28</td>
</tr>
<tr>
<td>1984-11-11</td>
<td>1984-11-28</td>
</tr>
<tr>
<td>1984-11-11</td>
<td>1984-11-28</td>
</tr>
</tbody>
</table>

Rows: 3

Truncating a Date

date.truncate() returns the Date value obtained by truncating a specified temporal instant value at the nearest preceding point in time at the specified component boundary (which is denoted by the truncation unit passed as a parameter to the function). In other words, the Date returned will have all components that are less significant than the specified truncation unit set to their default values.

It is possible to supplement the truncated value by providing a map containing components which are less significant than the truncation unit. This will have the effect of overriding the default values which would otherwise have been set for these less significant components. For example, `day` — with some value `x` — may be provided when the truncation unit is `year` in order to ensure the returned value has the day set to `x` instead of the default `day` (which is `1`).

Syntax: `date.truncate(unit [, temporalInstantValue [, mapOfComponents ]])`

Returns: A Date.

Arguments:

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>unit</td>
<td>A string expression evaluating to one of the following: <code>{millennium, century, decade, year, weekYear, quarter, month, week, day}</code>.</td>
</tr>
<tr>
<td>temporalInstantValue</td>
<td>An expression of one of the following types: <code>{DateTime, LocalDateTime, Date}</code>.</td>
</tr>
</tbody>
</table>

### 10.9.3. DateTime: `datetime()`

Details for using the `datetime()` function.

- Getting the current DateTime
- Creating a calendar (Year-Month-Day) DateTime
- Creating a week (Year-Week-Day) DateTime
- Creating a quarter (Year-Quarter-Day) DateTime
- Creating an ordinal (Year-Day) DateTime
- Creating a DateTime from a string
- Creating a DateTime using other temporal values as components
- Creating a DateTime from a timestamp
- Truncating a DateTime

Getting the current DateTime

datetime() returns the current DateTime value. If no time zone parameter is specified, the default time zone will be used.

**Syntax:** datetime([timezone])

**Returns:** A DateTime.

**Arguments:**

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>A single map consisting of the following:</td>
<td></td>
</tr>
<tr>
<td>timezone</td>
<td>A string expression that represents the time zone</td>
</tr>
</tbody>
</table>

**Considerations:**

If no parameters are provided, datetime() must be invoked (datetime() is invalid).

**Query**

```sql
RETURN datetime() AS currentDateTime
```

The current date and time using the local time zone is returned.

**Table 361. Result**

<table>
<thead>
<tr>
<th>currentDateTime</th>
</tr>
</thead>
<tbody>
<tr>
<td>2022-08-09T13:05:30.513Z</td>
</tr>
</tbody>
</table>

Rows: 1

**Query**

```sql
RETURN datetime({timezone: 'America/Los Angeles'}) AS currentDateTimeInLA
```

The current date and time of day in California is returned.

**Table 362. Result**

<table>
<thead>
<tr>
<th>currentDateTimeInLA</th>
</tr>
</thead>
<tbody>
<tr>
<td>2022-08-09T06:05:30.531-07:00[America/Los_Angeles]</td>
</tr>
</tbody>
</table>

Rows: 1
datetime.transaction()

datetime.transaction() returns the current DateTime value using the transaction clock. This value will be the same for each invocation within the same transaction. However, a different value may be produced for different transactions.

Syntax: datetime.transaction([time zone])

Returns:

A DateTime.

Arguments:

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>timezone</td>
<td>A string expression that represents the time zone</td>
</tr>
</tbody>
</table>

Query

```
RETURN datetime.transaction() AS currentDateTime
```

Table 363. Result

<table>

</thead>
<tbody>
<tr>
<td>2022-08-09T06:05:30.572-07:00[America/Los_Angeles]</td>
</tr>
<tr>
<td>Rows: 1</td>
</tr>
</tbody>
</table>

datetime.statement()

datetime.statement() returns the current DateTime value using the statement clock. This value will be the same for each invocation within the same statement. However, a different value may be produced for different statements within the same transaction.

Syntax: datetime.statement([time zone])

Returns:
A DateTime.

Arguments:

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>timezone</td>
<td>A string expression that represents the time zone</td>
</tr>
</tbody>
</table>

Query

```
RETURN datetime(). AS currentDateTime
```

Table 365. Result

<table>
<thead>
<tr>
<th>currentDateTime</th>
</tr>
</thead>
<tbody>
<tr>
<td>2022-08-09T13:05:30.611Z</td>
</tr>
</tbody>
</table>

Rows: 1

datetime.realtime()

datetime.realtime() returns the current DateTime value using the realtime clock. This value will be the live clock of the system.

Syntax: `datetime.realtime([timezone])`

Returns:

A DateTime.

Arguments:

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>timezone</td>
<td>A string expression that represents the time zone</td>
</tr>
</tbody>
</table>

Query

```
RETURN datetime.realtime() AS currentDateTime
```

Table 366. Result

<table>
<thead>
<tr>
<th>currentDateTime</th>
</tr>
</thead>
<tbody>
<tr>
<td>2022-08-09T13:05:30.652873Z</td>
</tr>
</tbody>
</table>

Rows: 1

Creating a calendar (Year-Month-Day) DateTime

datetime() returns a DateTime value with the specified year, month, day, hour, minute, second,
millisecond, microsecond, nanosecond and timezone component values.

Syntax: `datetime({year [, month, day, hour, minute, second, millisecond, microsecond, nanosecond, timezone]})`

Returns:

A DateTime.

Arguments:

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>A single map consisting of the following:</td>
<td></td>
</tr>
<tr>
<td>year</td>
<td>An expression consisting of at least four digits that specifies the year.</td>
</tr>
<tr>
<td>month</td>
<td>An integer between 1 and 12 that specifies the month.</td>
</tr>
<tr>
<td>day</td>
<td>An integer between 1 and 31 that specifies the day of the month.</td>
</tr>
<tr>
<td>hour</td>
<td>An integer between 0 and 23 that specifies the hour of the day.</td>
</tr>
<tr>
<td>minute</td>
<td>An integer between 0 and 59 that specifies the number of minutes.</td>
</tr>
<tr>
<td>second</td>
<td>An integer between 0 and 59 that specifies the number of seconds.</td>
</tr>
<tr>
<td>millisecond</td>
<td>An integer between 0 and 999 that specifies the number of milliseconds.</td>
</tr>
<tr>
<td>microsecond</td>
<td>An integer between 0 and 999,999 that specifies the number of microseconds.</td>
</tr>
<tr>
<td>nanosecond</td>
<td>An integer between 0 and 999,999,999 that specifies the number of nanoseconds.</td>
</tr>
<tr>
<td>timezone</td>
<td>An expression that specifies the time zone.</td>
</tr>
</tbody>
</table>

Considerations:

The month component will default to 1 if `month` is omitted.

The day of the month component will default to 1 if `day` is omitted.

The hour component will default to 0 if `hour` is omitted.

The minute component will default to 0 if `minute` is omitted.

The second component will default to 0 if `second` is omitted.

Any missing millisecond, microsecond or nanosecond values will default to 0.

The timezone component will default to the configured default time zone if `timezone` is omitted.
If `millisecond`, `microsecond` and `nanosecond` are given in combination (as part of the same set of parameters), the individual values must be in the range 0 to 999.

The least significant components in the set `year`, `month`, `day`, `hour`, `minute`, and `second` may be omitted; i.e. it is possible to specify only `year`, `month` and `day`, but specifying `year`, `month`, `day` and `minute` is not permitted.

One or more of `millisecond`, `microsecond` and `nanosecond` can only be specified as long as `second` is also specified.

### Query

```sql
UNWIND [
  datetime({year: 1984, month: 10, day: 11, hour: 12, minute: 31, second: 14, millisecond: 645, timezone: '+01:00'}),
  datetime({year: 1984, month: 10, day: 11, hour: 12, minute: 31, second: 14, timezone: '+01:00'}),
  datetime({year: 1984, month: 10, day: 11, hour: 12, minute: 31, timezone: 'Europe/Stockholm'}),
  datetime({year: 1984, month: 10, day: 11, timezone: '+01:00'}),
  datetime({year: 1984, month: 10, timezone: 'Europe/Stockholm'}),
  datetime({year: 1984, timezone: '+01:00'}),
  datetime({timezone: 'Europe/Stockholm'})
] as theDate
RETURN theDate
```

### Table 367. Result

<table>
<thead>
<tr>
<th>theDate</th>
</tr>
</thead>
<tbody>
<tr>
<td>1984-10-11T12:31:14.645+01:00</td>
</tr>
<tr>
<td>1984-10-11T12:31:14+01:00</td>

### Creating a week (Year-Week-Day) DateTime

`datetime()` returns a DateTime value with the specified year, week, `dayOfWeek`, `hour`, `minute`, `second`, `millisecond`, `microsecond`, `nanosecond` and `timezone` component values.

**Syntax:**

```sql
datetime({year [, week, dayOfWeek, hour, minute, second, millisecond, microsecond, nanosecond, timezone]})
```

**Returns:**

A DateTime.

**Arguments:**
<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>A single map consisting of the following:</td>
<td></td>
</tr>
<tr>
<td>year</td>
<td>An expression consisting of at least four digits that specifies the year.</td>
</tr>
<tr>
<td>week</td>
<td>An integer between 1 and 53 that specifies the week.</td>
</tr>
<tr>
<td>dayOfWeek</td>
<td>An integer between 1 and 7 that specifies the day of the week.</td>
</tr>
<tr>
<td>hour</td>
<td>An integer between 0 and 23 that specifies the hour of the day.</td>
</tr>
<tr>
<td>minute</td>
<td>An integer between 0 and 59 that specifies the number of minutes.</td>
</tr>
<tr>
<td>second</td>
<td>An integer between 0 and 59 that specifies the number of seconds.</td>
</tr>
<tr>
<td>millisecond</td>
<td>An integer between 0 and 999 that specifies the number of milliseconds.</td>
</tr>
<tr>
<td>microsecond</td>
<td>An integer between 0 and 999,999 that specifies the number of microseconds.</td>
</tr>
<tr>
<td>nanosecond</td>
<td>An integer between 0 and 999,999,999 that specifies the number of nanoseconds.</td>
</tr>
<tr>
<td>timezone</td>
<td>An expression that specifies the time zone.</td>
</tr>
</tbody>
</table>

**Considerations:**

- The week component will default to 1 if week is omitted.
- The day of the week component will default to 1 if dayOfWeek is omitted.
- The hour component will default to 0 if hour is omitted.
- The minute component will default to 0 if minute is omitted.
- The second component will default to 0 if second is omitted.
- Any missing millisecond, microsecond or nanosecond values will default to 0.
- The timezone component will default to the configured default time zone if timezone is omitted.
- If millisecond, microsecond and nanosecond are given in combination (as part of the same set of parameters), the individual values must be in the range 0 to 999.
- The least significant components in the set year, week, dayOfWeek, hour, minute, and second may be omitted; i.e. it is possible to specify only year, week and dayOfWeek, but specifying year, week, dayOfWeek and minute is not permitted.
- One or more of millisecond, microsecond and nanosecond can only be specified as long as second is also specified.

<td>microsecond</td>
<td>An integer between 0 and 999,999 that specifies the number of microseconds.</td>
</tr>
<tr>
<td>nanosecond</td>
<td>An integer between 0 and 999,999,999 that specifies the number of nanoseconds.</td>
</tr>
<tr>
<td>timezone</td>
<td>An expression that specifies the time zone.</td>
</tr>
</tbody>
</table>

**Considerations:**

- The quarter component will default to 1 if `quarter` is omitted.
- The day of the quarter component will default to 1 if `dayOfQuarter` is omitted.
- The hour component will default to 0 if `hour` is omitted.
- The minute component will default to 0 if `minute` is omitted.
- The second component will default to 0 if `second` is omitted.
- Any missing `millisecond`, `microsecond` or `nanosecond` values will default to 0.
- The timezone component will default to the configured default time zone if `timezone` is omitted.
- If `millisecond`, `microsecond` and `nanosecond` are given in combination (as part of the same set of parameters), the individual values must be in the range 0 to 999.
- The least significant components in the set `year`, `quarter`, `dayOfQuarter`, `hour`, `minute`, and `second` may be omitted; i.e. it is possible to specify only `year`, `quarter` and `dayOfQuarter`, but specifying `year`, `quarter`, `dayOfQuarter` and `minute` is not permitted.
- One or more of `millisecond`, `microsecond` and `nanosecond` can only be specified as long as `second` is also specified.

**Query**

```plaintext
UNWIND [
  {year: 1984, quarter: 3, dayOfQuarter: 45, hour: 12, minute: 31, second: 14, microsecond: 645876},
  {year: 1984, quarter: 3, dayOfQuarter: 45, hour: 12, minute: 31, second: 14, timezone: '+01:00'},
  {year: 1984, quarter: 3, dayOfQuarter: 45, hour: 12, timezone: 'Europe/Stockholm'},
  {year: 1984, quarter: 3, dayOfQuarter: 45}
] as theDate
RETURN theDate
```

**Table 369. Result**

<table>
<thead>
<tr>
<th>theDate</th>
</tr>
</thead>
<tbody>
<tr>
<td>1984-08-14T12:31:14.645876Z</td>
</tr>
</tbody>
</table>
Creating an ordinal (Year-Day) DateTime

datetime() returns a DateTime value with the specified year, ordinalDay, hour, minute, second, millisecond, microsecond, nanosecond and timezone component values.

Syntax: datetime({year [, ordinalDay, hour, minute, second, millisecond, microsecond, nanosecond, timezone]})

Returns:

A DateTime.

Arguments:

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>A single map consisting of the following:</td>
<td></td>
</tr>
<tr>
<td>year</td>
<td>An expression consisting of at least four digits that specifies the year.</td>
</tr>
<tr>
<td>ordinalDay</td>
<td>An integer between 1 and 366 that specifies the ordinal day of the year.</td>
</tr>
<tr>
<td>hour</td>
<td>An integer between 0 and 23 that specifies the hour of the day.</td>
</tr>
<tr>
<td>minute</td>
<td>An integer between 0 and 59 that specifies the number of minutes.</td>
</tr>
<tr>
<td>second</td>
<td>An integer between 0 and 59 that specifies the number of seconds.</td>
</tr>
<tr>
<td>millisecond</td>
<td>An integer between 0 and 999 that specifies the number of milliseconds.</td>
</tr>
<tr>
<td>microsecond</td>
<td>An integer between 0 and 999,999 that specifies the number of microseconds.</td>
</tr>
<tr>
<td>nanosecond</td>
<td>An integer between 0 and 999,999,999 that specifies the number of nanoseconds.</td>
</tr>
<tr>
<td>timezone</td>
<td>An expression that specifies the time zone.</td>
</tr>
</tbody>
</table>

Considerations:

The ordinal day of the year component will default to 1 if ordinalDay is omitted.
The hour component will default to \(0\) if \(\text{hour}\) is omitted.

The minute component will default to \(0\) if \(\text{minute}\) is omitted.

The second component will default to \(0\) if \(\text{second}\) is omitted.

Any missing \text{millisecond}, \text{microsecond} or \text{nanosecond} values will default to \(0\).

The timezone component will default to the configured default time zone if \(\text{timezone}\) is omitted.

If \text{millisecond}, \text{microsecond} and \text{nanosecond} are given in combination (as part of the same set of parameters), the individual values must be in the range \(0\) to \(999\).

The least significant components in the set \text{year}, \text{ordinalDay}, \text{hour}, \text{minute}, and \text{second} may be omitted; i.e. it is possible to specify only \text{year} and \text{ordinalDay}, but specifying \text{year}, \text{ordinalDay} and \text{minute} is not permitted.

One or more of \text{millisecond}, \text{microsecond} and \text{nanosecond} can only be specified as long as \text{second} is also specified.

Query

```
UNWIND [
  datetime({year:1984, ordinalDay:202, hour:12, minute:31, second:14, timezone: '+01:00'}),
  datetime({year:1984, ordinalDay:202})
] as theDate
RETURN theDate
```

</tbody>
</table>

Rows: 4

Creating a \text{DateTime} from a string

\text{datetime()} returns the \text{DateTime} value obtained by parsing a string representation of a temporal value.

Syntax: \text{datetime(temporalValue)}

Returns:

A \text{DateTime}.

Arguments:

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>temporalValue</td>
<td>A string representing a temporal value.</td>
</tr>
</tbody>
</table>

Considerations:
temporalValue must comply with the format defined for dates, times and time zones.

The timezone component will default to the configured default time zone if it is omitted.

temporalValue must denote a valid date and time; i.e. a temporalValue denoting 30 February 2001 is invalid.

datetime(null) returns null.

Query

```
UNWIND [
    datetime('2015-07-21T21:40:32.142+0100'),
    datetime('2015-W30-2T214032.142Z'),
    datetime('2015T214032-0100'),
    datetime('20150721T21:40-01:30'),
    datetime('2015-W30T2140-02'),
    datetime('2015202T21+18:00'),
    datetime('2015-07-21T21:40:32.142[Europe/London]'),
    datetime('2015-07-21T21:40:32.142-04[America/New_York]')
] AS theDate
RETURN theDate
```

</tr>
</tbody>
</table>

Rows: 8

Creating a DateTime using other temporal values as components

datetime() returns the DateTime value obtained by selecting and composing components from another temporal value. In essence, this allows a Date, LocalDateTime, Time or LocalTime value to be converted to a DateTime, and for "missing" components to be provided.

Syntax: datetime({datetime [, year, …, timezone]}) | datetime({date [, year, …, timezone]}) |
datetime({time [, year, …, timezone]}) | datetime({date, time [, year, …, timezone]})

Returns:

A DateTime.

Arguments:

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>A single map consisting of the following:</td>
<td></td>
</tr>
<tr>
<td>Name</td>
<td>Description</td>
</tr>
<tr>
<td>-----------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>datetime</td>
<td>A DateTime value.</td>
</tr>
<tr>
<td>date</td>
<td>A Date value.</td>
</tr>
<tr>
<td>time</td>
<td>A Time value.</td>
</tr>
<tr>
<td>year</td>
<td>An expression consisting of at least four digits that specifies the year.</td>
</tr>
<tr>
<td>month</td>
<td>An integer between 1 and 12 that specifies the month.</td>
</tr>
<tr>
<td>day</td>
<td>An integer between 1 and 31 that specifies the day of the month.</td>
</tr>
<tr>
<td>week</td>
<td>An integer between 1 and 53 that specifies the week.</td>
</tr>
<tr>
<td>dayOfWeek</td>
<td>An integer between 1 and 7 that specifies the day of the week.</td>
</tr>
<tr>
<td>quarter</td>
<td>An integer between 1 and 4 that specifies the quarter.</td>
</tr>
<tr>
<td>dayOfQuarter</td>
<td>An integer between 1 and 92 that specifies the day of the quarter.</td>
</tr>
<tr>
<td>ordinalDay</td>
<td>An integer between 1 and 366 that specifies the ordinal day of the year.</td>
</tr>
<tr>
<td>hour</td>
<td>An integer between 0 and 23 that specifies the hour of the day.</td>
</tr>
<tr>
<td>minute</td>
<td>An integer between 0 and 59 that specifies the number of minutes.</td>
</tr>
<tr>
<td>second</td>
<td>An integer between 0 and 59 that specifies the number of seconds.</td>
</tr>
<tr>
<td>millisecond</td>
<td>An integer between 0 and 999 that specifies the number of milliseconds.</td>
</tr>
<tr>
<td>microsecond</td>
<td>An integer between 0 and 999,999 that specifies the number of microseconds.</td>
</tr>
<tr>
<td>nanosecond</td>
<td>An integer between 0 and 999,999,999 that specifies the number of nanoseconds.</td>
</tr>
<tr>
<td>timezone</td>
<td>An expression that specifies the time zone.</td>
</tr>
</tbody>
</table>

**Considerations:**

If any of the optional parameters are provided, these will override the corresponding components of `datetime`, `date` and/or `time`.

`datetime(dd)` may be written instead of `datetime({datetime: dd})`.

Selecting a `Time` or `DateTime` value as the `time` component also selects its time zone. If a `LocalTime` or `LocalDateTime` is selected instead, the default time zone is used. In any case, the time zone can be overridden explicitly.

Selecting a `DateTime` as the `datetime` component and overwriting the time zone will adjust the local time to keep the same point in time.
Selecting a DateTime or Time as the time component and overwriting the time zone will adjust the local time to keep the same point in time.

The following query shows the various usages of `datetime([date [, year, ... , timezone]])`

Query

```sql
WITH date({year: 1984, month: 10, day: 11}) AS dd
RETURN datetime({date: dd, hour: 10, minute: 10, second: 10}) AS dateHHMMSS,
    datetime({date: dd, hour: 10, minute: 10, second: 10, timezone: '+05:00'}) AS dateHHMMSSTimezone,
    datetime({date: dd, day: 28, hour: 10, minute: 10, second: 10}) AS dateDDHHMMSS,
    datetime({date: dd, day: 28, hour: 10, minute: 10, second: 10, timezone: 'Pacific/Honolulu'}) AS dateDDHHMMSSTimezone
```

Table 372. Result

<table>
<thead>
<tr>
<th>dateHHMMSS</th>
<th>dateHHMMSSTimezone</th>
<th>dateDDHHMMSS</th>
<th>dateDDHHMMSSTimezone</th>
</tr>
</thead>
</table>

Rows: 1

The following query shows the various usages of `datetime([time [, year, ... , timezone]])`; i.e. combining a Date and a Time value to create a single DateTime value:

Query

```sql
WITH time({hour: 12, minute: 31, second: 14, millisecond: 645876, timezone: '+01:00'}) AS tt
RETURN datetime({year: 1984, month: 10, day: 11, time: tt}) AS YYYYMMDDTime,
    datetime({year: 1984, month: 10, day: 11, time: tt, timezone: '+05:00'}) AS YYYYMMDDTimeTimezone,
    datetime({year: 1984, month: 10, day: 11, time: tt, second: 42}) AS YYYYMMDDTimeSS,
    datetime({year: 1984, month: 10, day: 11, time: tt, second: 42, timezone: 'Pacific/Honolulu'}) AS YYYYMMDDTimeSSTimezone
```

Table 373. Result

<table>
<thead>
<tr>
<th>YYYYMMDDTime</th>
<th>YYYYMMDDTimeTimezone</th>
<th>YYYYMMDDTimeSS</th>
<th>YYYYMMDDTimeSSTimezone</th>
</tr>
</thead>
</table>

Rows: 1
The following query shows the various usages of `datetime([datetime [, year, ..., timezone]])`.

```
WITH datetime({
  year: 1984,
  month: 10,
  day: 11,
  hour: 12,
  timezone: 'Europe/Stockholm'
}) AS dd
RETURN datetime({
  datetime: dd
}) AS dateTime,
datetime({
  datetime: dd,
  timezone: '+05:00'
}) AS dateTimeTimezone,
datetime({
  datetime: dd,
  day: 28,
  second: 42
}) AS dateTimeDDSS,
datetime({
  datetime: dd,
  day: 28,

<th>dateTimeDDSSTimezone</th>
</tr>
</thead>
</table>

The `dateTime()` function returns the DateTime value at the specified number of seconds or milliseconds from the UNIX epoch in the UTC time zone.

Conversions to other temporal instant types from UNIX epoch representations can be achieved by transforming a DateTime value to one of these types.

**Syntax:** `datetime({ epochSeconds | epochMillis })`

**Returns:** A DateTime.

**Arguments:**

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>A single map consisting of the following:</td>
<td></td>
</tr>
<tr>
<td>epochSeconds</td>
<td>A numeric value representing the number of seconds from the UNIX epoch in the UTC time zone.</td>
</tr>
<tr>
<td>epochMillis</td>
<td>A numeric value representing the number of milliseconds from the UNIX epoch in the UTC time zone.</td>
</tr>
</tbody>
</table>

**Considerations:**

`epochSeconds/epochMillis` may be used in conjunction with nanosecond.
Query

```
RETURN datetime({epochSeconds:timestamp() / 1000, nanosecond: 23}) AS theDate
```

Table 376. Result

<table>
<thead>
<tr>
<th>theDate</th>

</tbody>
</table>

Rows: 1

Truncating a DateTime

datetime.truncate() returns the DateTime value obtained by truncating a specified temporal instant value at the nearest preceding point in time at the specified component boundary (which is denoted by the truncation unit passed as a parameter to the function). In other words, the DateTime returned will have all components that are less significant than the specified truncation unit set to their default values.

It is possible to supplement the truncated value by providing a map containing components which are less significant than the truncation unit. This will have the effect of overriding the default values which would otherwise have been set for these less significant components. For example, day — with some value x — may be provided when the truncation unit is year in order to ensure the returned value has the day set to x instead of the default day (which is 1).

Syntax: `datetime.truncate(unit [, temporalInstantValue [, mapOfComponents ]])`

Returns:

A DateTime.

Arguments:

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>unit</td>
<td>A string expression evaluating to one of the following: [millennium, century, decade, year, weekYear, quarter, month, week, day, hour, minute, second, millisecond, microsecond].</td>
</tr>
<tr>
<td>temporalInstantValue</td>
<td>An expression of one of the following types: [DateTime, LocalDateTime, Date].</td>
</tr>
</tbody>
</table>
### mapOfComponents

An expression evaluating to a map containing components less significant than `unit`. During truncation, a time zone can be attached or overridden using the key `timezone`.

#### Considerations:

- `temporalInstantValue` cannot be a `Date` value if `unit` is one of `{hour, minute, second, millisecond, microsecond}`.
- The time zone of `temporalInstantValue` may be overridden; for example, `datetime.truncate('minute', input, {timezone:'+0200'})`.
- If `temporalInstantValue` is one of `{Time, DateTime}` — a value with a time zone — and the time zone is overridden, no time conversion occurs.
- If `temporalInstantValue` is one of `{LocalDateTime, Date}` — a value without a time zone — and the time zone is not overridden, the configured default time zone will be used.
- Any component that is provided in `mapOfComponents` must be less significant than `unit`; i.e. if `unit` is 'day', `mapOfComponents` cannot contain information pertaining to a month.
- Any component that is not contained in `mapOfComponents` and which is less significant than `unit` will be set to its minimal value.
- If `mapOfComponents` is not provided, all components of the returned value which are less significant than `unit` will be set to their default values.
- If `temporalInstantValue` is not provided, it will be set to the current date, time and timezone, i.e. `datetime.truncate(unit)` is equivalent of `datetime.truncate(unit, datetime())`.

#### Query

```sql
WITH
datetime({
year:2017,
month:11,
day:11,
hour:12,
minute:31,
second:14,
nanosecond:645876123,
timezone:'+03:00'
}) AS d
RETURN
datetime.truncate('millennium', d, {timezone:'Europe/Stockholm'}) AS truncMillenium,
datetime.truncate('year', d, {day:5}) AS truncYear,
datetime.truncate('month', d) AS truncMonth,
datetime.truncate('day', d, {millisecond:2}) AS truncDay,
datetime.truncate('hour', d) AS truncHour,
datetime.truncate('second', d) AS truncSecond
```

#### Table 378. Result

<table>
<thead>
<tr>
<th>truncMillenium</th>
<th>truncYear</th>
<th>truncMonth</th>
<th>truncDay</th>
<th>truncHour</th>
<th>truncSecond</th>

### 10.9.4. LocalDateTime: `localdatetime()`

**Details for using the `localdatetime()` function.**

- Getting the current `LocalDateTime`
• Creating a calendar (Year-Month-Day) LocalDateTime
• Creating a week (Year-Week-Day) LocalDateTime
• Creating a quarter (Year-Quarter-Day) LocalDateTime
• Creating an ordinal (Year-Day) LocalDateTime
• Creating a LocalDateTime from a string
• Creating a LocalDateTime using other temporal values as components
• Truncating a LocalDateTime

Getting the current LocalDateTime

`localdatetime()` returns the current LocalDateTime value. If no time zone parameter is specified, the local time zone will be used.

**Syntax:** `localdatetime([timezone])`

**Returns:**
A LocalDateTime.

**Arguments:**

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>A single map consisting of the following:</td>
<td></td>
</tr>
<tr>
<td>timezone</td>
<td>A string expression that represents the time zone</td>
</tr>
</tbody>
</table>

**Considerations:**

If no parameters are provided, `localdatetime()` must be invoked (`localdatetime({})` is invalid).

**Query**

```
RETURN localdatetime() AS now
```

The current local date and time (i.e. in the local time zone) is returned.

**Table 379. Result**

<table>
<thead>
<tr>
<th>now</th>
</tr>
</thead>
<tbody>
<tr>
<td>2022-08-09T13:05:31.543</td>
</tr>
</tbody>
</table>

Rows: 1

**Query**

```
RETURN localdatetime({'timezone: 'America/Los Angeles'})) AS now
```

The current local date and time in California is returned.
locdatetime.transaction()

_locdatetime.transaction() returns the current LocalDateTime value using the transaction clock. This value will be the same for each invocation within the same transaction. However, a different value may be produced for different transactions.

**Syntax:** `locdatetime.transaction([[timezone]])`

**Returns:**

A LocalDateTime.

**Arguments:**

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>timezone</td>
<td>A string expression that represents the time zone</td>
</tr>
</tbody>
</table>

**Query**

```sql
RETURN locdatetime.transaction() AS now
```

locdatetime.statement()

_locdatetime.statement() returns the current LocalDateTime value using the statement clock. This value will be the same for each invocation within the same statement. However, a different value may be produced for different statements within the same transaction.

**Syntax:** `locdatetime.statement([[timezone]])`

**Returns:**

A LocalDateTime.

**Arguments:**
### timezone

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>timezone</td>
<td>A string expression that represents the time zone</td>
</tr>
</tbody>
</table>

**Query**

```sql
RETURN localdatetime.statement() AS now
```

**Table 382. Result**

<table>
<thead>
<tr>
<th>now</th>
<th>2022-08-09T13:05:31.605</th>
</tr>
</thead>
<tbody>
<tr>
<td>Rows:</td>
<td>1</td>
</tr>
</tbody>
</table>

`localdatetime.realtime()` returns the current `LocalDateTime` value using the `realtime` clock. This value will be the live clock of the system.

**Syntax:** `localdatetime.realtime([timezone])`

**Returns:**

A `LocalDateTime`.

**Arguments:**

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>timezone</td>
<td>A string expression that represents the time zone</td>
</tr>
</tbody>
</table>

**Query**

```sql
RETURN localdatetime.realtime() AS now
```

**Table 383. Result**

<table>
<thead>
<tr>
<th>now</th>
<th>2022-08-09T13:05:31.648376</th>
</tr>
</thead>
<tbody>
<tr>
<td>Rows:</td>
<td>1</td>
</tr>
</tbody>
</table>

**Query**

```sql
RETURN localdatetime.realtime('America/Los Angeles') AS nowInLA
```

**Table 384. Result**

<table>
<thead>
<tr>
<th>nowInLA</th>
<th>2022-08-09T06:05:31.664647</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
</tr>
</tbody>
</table>
Creating a calendar (Year-Month-Day) LocalDateTime

`localdatetime()` returns a LocalDateTime value with the specified year, month, day, hour, minute, second, millisecond, microsecond and nanosecond component values.

**Syntax:** `localdatetime({year [, month, day, hour, minute, second, millisecond, microsecond, nanosecond]})`

**Returns:**

A LocalDateTime.

**Arguments:**

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>A single map consisting of the following:</td>
<td></td>
</tr>
<tr>
<td>year</td>
<td>An expression consisting of at least four digits that specifies the year.</td>
</tr>
<tr>
<td>month</td>
<td>An integer between 1 and 12 that specifies the month.</td>
</tr>
<tr>
<td>day</td>
<td>An integer between 1 and 31 that specifies the day of the month.</td>
</tr>
<tr>
<td>hour</td>
<td>An integer between 0 and 23 that specifies the hour of the day.</td>
</tr>
<tr>
<td>minute</td>
<td>An integer between 0 and 59 that specifies the number of minutes.</td>
</tr>
<tr>
<td>second</td>
<td>An integer between 0 and 59 that specifies the number of seconds.</td>
</tr>
<tr>
<td>millisecond</td>
<td>An integer between 0 and 999 that specifies the number of milliseconds.</td>
</tr>
<tr>
<td>microsecond</td>
<td>An integer between 0 and 999,999 that specifies the number of microseconds.</td>
</tr>
<tr>
<td>nanosecond</td>
<td>An integer between 0 and 999,999,999 that specifies the number of nanoseconds.</td>
</tr>
</tbody>
</table>

**Considerations:**

- The month component will default to 1 if `month` is omitted.
- The day of the month component will default to 1 if `day` is omitted.
- The hour component will default to 0 if `hour` is omitted.
- The minute component will default to 0 if `minute` is omitted.
The second component will default to 0 if second is omitted.

Any missing millisecond, microsecond or nanosecond values will default to 0.

If millisecond, microsecond and nanosecond are given in combination (as part of the same set of parameters), the individual values must be in the range 0 to 999.

The least significant components in the set year, month, day, hour, minute, and second may be omitted; i.e. it is possible to specify only year, month and day, but specifying year, month, day and minute is not permitted.

One or more of millisecond, microsecond and nanosecond can only be specified as long as second is also specified.

Query

```java
RETURN localdatetime({year: 1984, month: 10, day: 11, hour: 12, minute: 31, second: 14, millisecond: 123, microsecond: 456, nanosecond: 789}) AS theDate
```

Table 385. Result

<table>
<thead>
<tr>
<th>theDate</th>
</tr>
</thead>
</table>

Rows: 1

Creating a week (Year-Week-Day) LocalDateTime

`localdatetime()` returns a `LocalDateTime` value with the specified year, week, dayOfWeek, hour, minute, second, millisecond, microsecond and nanosecond component values.

**Syntax:** `localdatetime({year [, week, dayOfWeek, hour, minute, second, millisecond, microsecond, nanosecond]})`

**Returns:**

A LocalDateTime.

**Arguments:**

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>A single map consisting of the following:</td>
<td></td>
</tr>
<tr>
<td>year</td>
<td>An expression consisting of at least four digits that specifies the year.</td>
</tr>
<tr>
<td>week</td>
<td>An integer between 1 and 53 that specifies the week.</td>
</tr>
<tr>
<td>dayOfWeek</td>
<td>An integer between 1 and 7 that specifies the day of the week.</td>
</tr>
<tr>
<td>hour</td>
<td>An integer between 0 and 23 that specifies the hour of the day.</td>
</tr>
<tr>
<td>minute</td>
<td>An integer between 0 and 59 that specifies the number of minutes.</td>
</tr>
<tr>
<td>Name</td>
<td>Description</td>
</tr>
<tr>
<td>-------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>second</td>
<td>An integer between 0 and 59 that specifies the number of seconds.</td>
</tr>
<tr>
<td>millisecond</td>
<td>An integer between 0 and 999 that specifies the number of milliseconds.</td>
</tr>
<tr>
<td>microsecond</td>
<td>An integer between 0 and 999,999 that specifies the number of microseconds.</td>
</tr>
<tr>
<td>nanosecond</td>
<td>An integer between 0 and 999,999,999 that specifies the number of nanoseconds.</td>
</tr>
</tbody>
</table>

Considerations:

The week component will default to 1 if week is omitted.

The day of the week component will default to 1 if dayOfWeek is omitted.

The hour component will default to 0 if hour is omitted.

The minute component will default to 0 if minute is omitted.

The second component will default to 0 if second is omitted.

Any missing millisecond, microsecond or nanosecond values will default to 0.

If millisecond, microsecond and nanosecond are given in combination (as part of the same set of parameters), the individual values must be in the range 0 to 999.

The least significant components in the set year, week, dayOfWeek, hour, minute, and second may be omitted; i.e. it is possible to specify only year, week and dayOfWeek, but specifying year, week, dayOfWeek and minute is not permitted.

One or more of millisecond, microsecond and nanosecond can only be specified as long as second is also specified.

Query

```java
RETURN localdatetime({year:1984, week:10, dayOfWeek:3, hour:12, minute:31, second:14, millisecond:645}) AS theDate
```

Table 386. Result

<table>
<thead>
<tr>
<th>theDate</th>
</tr>
</thead>
<tbody>
<tr>
<td>1984-03-07T12:31:14.645</td>
</tr>
</tbody>
</table>

Rows: 1

Creating a quarter (Year-Quarter-Day) DateTime

`localdatetime()` returns a LocalDateTime value with the specified year, quarter, dayOfQuarter, hour, minute, second, millisecond, microsecond and nanosecond component values.

**Syntax:** `localdatetime((year [, quarter, dayOfQuarter, hour, minute, second, millisecond, microsecond, nanosecond]))`

**Returns:**
A `LocalDateTime`.

**Arguments:**

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>A single map consisting of the following:</strong></td>
<td></td>
</tr>
<tr>
<td>year</td>
<td>An expression consisting of at least four digits that specifies the year.</td>
</tr>
<tr>
<td>quarter</td>
<td>An integer between 1 and 4 that specifies the quarter.</td>
</tr>
<tr>
<td>dayOfQuarter</td>
<td>An integer between 1 and 92 that specifies the day of the quarter.</td>
</tr>
<tr>
<td>hour</td>
<td>An integer between 0 and 23 that specifies the hour of the day.</td>
</tr>
<tr>
<td>minute</td>
<td>An integer between 0 and 59 that specifies the number of minutes.</td>
</tr>
<tr>
<td>second</td>
<td>An integer between 0 and 59 that specifies the number of seconds.</td>
</tr>
<tr>
<td>millisecond</td>
<td>An integer between 0 and 999 that specifies the number of milliseconds.</td>
</tr>
<tr>
<td>microsecond</td>
<td>An integer between 0 and 999,999 that specifies the number of microseconds.</td>
</tr>
<tr>
<td>nanosecond</td>
<td>An integer between 0 and 999,999,999 that specifies the number of nanoseconds.</td>
</tr>
</tbody>
</table>

**Considerations:**

The quarter component will default to 1 if `quarter` is omitted.

The day of the quarter component will default to 1 if `dayOfQuarter` is omitted.

The hour component will default to 0 if `hour` is omitted.

The minute component will default to 0 if `minute` is omitted.

The second component will default to 0 if `second` is omitted.

Any missing `millisecond`, `microsecond` or `nanosecond` values will default to 0.

If `millisecond`, `microsecond` and `nanosecond` are given in combination (as part of the same set of parameters), the individual values must be in the range 0 to 999.

The least significant components in the set `year`, `quarter`, `dayOfQuarter`, `hour`, `minute`, and `second` may be omitted; i.e. it is possible to specify only `year`, `quarter` and `dayOfQuarter`, but specifying `year`, `quarter`, `dayOfQuarter` and `minute` is not permitted.

One or more of `millisecond`, `microsecond` and `nanosecond` can only be specified as long as `second` is also specified.
Query

```
RETURN localdatetime({year: 1984, quarter: 3, dayOfQuarter: 45, hour: 12, minute: 31, second: 14, nanosecond: 645876123}) AS theDate
```

<tr>
<td>1984-08-14T12:31:14.645876123</td>
</tr>
<tr>
<td>Rows: 1</td>
</tr>
</tbody>
</table>

Creating an ordinal (Year-Day) LocalDateTime

`localdatetime()` returns a `LocalDateTime` value with the specified `year`, `ordinalDay`, `hour`, `minute`, `second`, `millisecond`, `microsecond` and `nanosecond` component values.

**Syntax:**

```
localdatetime({year [, ordinalDay, hour, minute, second, millisecond, microsecond, nanosecond]])
```

**Returns:**

A `LocalDateTime`.

**Arguments:**

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>A single map consisting of the following:</td>
<td></td>
</tr>
<tr>
<td>year</td>
<td>An expression consisting of at least four digits that specifies the year.</td>
</tr>
<tr>
<td>ordinalDay</td>
<td>An integer between 1 and 366 that specifies the ordinal day of the year.</td>
</tr>
<tr>
<td>hour</td>
<td>An integer between 0 and 23 that specifies the hour of the day.</td>
</tr>
<tr>
<td>minute</td>
<td>An integer between 0 and 59 that specifies the number of minutes.</td>
</tr>
<tr>
<td>second</td>
<td>An integer between 0 and 59 that specifies the number of seconds.</td>
</tr>
<tr>
<td>millisecond</td>
<td>An integer between 0 and 999 that specifies the number of milliseconds.</td>
</tr>
<tr>
<td>microsecond</td>
<td>An integer between 0 and 999,999 that specifies the number of microseconds.</td>
</tr>
<tr>
<td>nanosecond</td>
<td>An integer between 0 and 999,999,999 that specifies the number of nanoseconds.</td>
</tr>
</tbody>
</table>

**Considerations:**
The ordinal day of the year component will default to 1 if \texttt{ordinalDay} is omitted.

The hour component will default to 0 if \texttt{hour} is omitted.

The minute component will default to 0 if \texttt{minute} is omitted.

The second component will default to 0 if \texttt{second} is omitted.

Any missing millisecond, microsecond or nanosecond values will default to 0.

If millisecond, microsecond and nanosecond are given in combination (as part of the same set of parameters), the individual values must be in the range 0 to 999.

The least significant components in the set year, ordinalDay, hour, minute, and second may be omitted; i.e. it is possible to specify only year and ordinalDay, but specifying year, ordinalDay and minute is not permitted.

One or more of millisecond, microsecond and nanosecond can only be specified as long as second is also specified.

Query

```
RETURN localdatetime({year: 1984, ordinalDay: 202, hour: 12, minute: 31, second: 14, microsecond: 645876}) AS theDate
```  

Table 388. Result

<table>
<thead>
<tr>
<th>theDate</th>
<th>1984-07-20T12:31:14.645876</th>
</tr>
</thead>
<tbody>
<tr>
<td>Rows:</td>
<td>1</td>
</tr>
</tbody>
</table>

Creating a \texttt{LocalDateTime} from a string

\texttt{localdatetime()} returns the \texttt{LocalDateTime} value obtained by parsing a string representation of a temporal value.

Syntax: \texttt{localdatetime(temporalValue)}

Returns:

A \texttt{LocalDateTime}.

Arguments:

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>\texttt{temporalValue}</td>
<td>A string representing a temporal value.</td>
</tr>
</tbody>
</table>

Considerations:

- \texttt{temporalValue} must comply with the format defined for \texttt{dates} and \texttt{times}.
- \texttt{temporalValue} must denote a valid date and time; i.e. a \texttt{temporalValue} denoting 30 February 2001 is invalid.
- \texttt{localdatetime(null)} returns null.
Query

```
UNWIND [
  localdatetime('2015-07-21T21:40:32.142'),
  localdatetime('2015-W30-2T214032.142'),
  localdatetime('2015-202T21:40:32'),
  localdatetime('2015202T21')
] AS theDate
RETURN theDate
```

Table 389. Result

<table>
<thead>
<tr>
<th>theDate</th>
</tr>
</thead>
<tbody>
<tr>
<td>2015-07-21T21:40:32.142</td>
</tr>
<tr>
<td>2015-07-21T21:40:32.142</td>
</tr>
<tr>
<td>2015-07-21T21:40:32</td>
</tr>
<tr>
<td>2015-07-21T21:00</td>
</tr>
<tr>
<td>Rows: 4</td>
</tr>
</tbody>
</table>

Creating a LocalDateTime using other temporal values as components

`localdatetime()` returns the `LocalDateTime` value obtained by selecting and composing components from another temporal value. In essence, this allows a `Date`, `DateTime`, `Time` or `LocalTime` value to be converted to a `LocalDateTime`, and for "missing" components to be provided.

Syntax: `localdatetime({datetime [, year, …, nanosecond]}) | localdatetime({date [, year, …, nanosecond]}) | localdatetime({time [, year, …, nanosecond]}) | localdatetime({date, time [, year, …, nanosecond]})`

Returns:

A `LocalDateTime`.

Arguments:

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>A single map consisting of the following:</td>
<td></td>
</tr>
<tr>
<td><code>datetime</code></td>
<td>A <code>DateTime</code> value.</td>
</tr>
<tr>
<td><code>date</code></td>
<td>A <code>Date</code> value.</td>
</tr>
<tr>
<td><code>time</code></td>
<td>A <code>Time</code> value.</td>
</tr>
<tr>
<td><code>year</code></td>
<td>An expression consisting of at least four digits that specifies the year.</td>
</tr>
<tr>
<td><code>month</code></td>
<td>An integer between 1 and 12 that specifies the month.</td>
</tr>
<tr>
<td><code>day</code></td>
<td>An integer between 1 and 31 that specifies the day of the month.</td>
</tr>
<tr>
<td><code>week</code></td>
<td>An integer between 1 and 53 that specifies the week.</td>
</tr>
<tr>
<td>Name</td>
<td>Description</td>
</tr>
<tr>
<td>--------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>dayOfWeek</td>
<td>An integer between 1 and 7 that specifies the day of the week.</td>
</tr>
<tr>
<td>quarter</td>
<td>An integer between 1 and 4 that specifies the quarter.</td>
</tr>
<tr>
<td>dayOfQuarter</td>
<td>An integer between 1 and 92 that specifies the day of the quarter.</td>
</tr>
<tr>
<td>ordinalDay</td>
<td>An integer between 1 and 366 that specifies the ordinal day of the year.</td>
</tr>
<tr>
<td>hour</td>
<td>An integer between 0 and 23 that specifies the hour of the day.</td>
</tr>
<tr>
<td>minute</td>
<td>An integer between 0 and 59 that specifies the number of minutes.</td>
</tr>
<tr>
<td>second</td>
<td>An integer between 0 and 59 that specifies the number of seconds.</td>
</tr>
<tr>
<td>millisecond</td>
<td>An integer between 0 and 999 that specifies the number of milliseconds.</td>
</tr>
<tr>
<td>microsecond</td>
<td>An integer between 0 and 999,999 that specifies the number of microseconds.</td>
</tr>
<tr>
<td>nanosecond</td>
<td>An integer between 0 and 999,999,999 that specifies the number of nanoseconds.</td>
</tr>
</tbody>
</table>

**Considerations:**

If any of the optional parameters are provided, these will override the corresponding components of `datetime, date and/or time.`

`localdatetime(dd)` may be written instead of `localdatetime({datetime: dd}).`

The following query shows the various usages of `localdatetime({date [, year, ..., nanosecond]})`

**Query**

```sql
WITH date({year:1984, month:10, day:11}) AS dd
RETURN localdatetime({date:dd, hour: 10, minute: 10, second: 10}) AS dateHHMMSS,
      localdatetime({date:dd, day: 28, hour: 10, minute: 10, second: 10}) AS dateDDHHMMSS
```

**Table 390. Result**

<table>
<thead>
<tr>
<th>dateHHMMSS</th>
<th>dateDDHHMMSS</th>
</tr>
</thead>
</table>

Rows: 1

The following query shows the various usages of `localdatetime({time [, year, ..., nanosecond]})`
Truncating a LocalDateTime

`localdatetime.truncate()` returns the `LocalDateTime` value obtained by truncating a specified temporal instant value at the nearest preceding point in time at the specified component boundary (which is denoted by the truncation unit passed as a parameter to the function). In other words, the `LocalDateTime` returned will have all components that are less significant than the specified truncation unit set to their default values.

It is possible to supplement the truncated value by providing a map containing components which are less
significant than the truncation unit. This will have the effect of overriding the default values which would otherwise have been set for these less significant components. For example, day — with some value $x$ — may be provided when the truncation unit is year in order to ensure the returned value has the day set to $x$ instead of the default day (which is 1).

**Syntax:** `localdatetime.truncate(unit [, temporalInstantValue [, mapOfComponents ]])`

**Returns:**
A LocalDateTime.

**Arguments:**

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>unit</td>
<td>A string expression evaluating to one of the following: millennium, century,</td>
</tr>
<tr>
<td></td>
<td>decade, year, weekYear, quarter, month, week, day, hour, minute, second,</td>
</tr>
<tr>
<td></td>
<td>millisecond, microsecond.</td>
</tr>
<tr>
<td>temporalInstantValue</td>
<td>An expression of one of the following types: DateTime, LocalDateTime, Date.</td>
</tr>
<tr>
<td>mapOfComponents</td>
<td>An expression evaluating to a map containing components less significant than unit.</td>
</tr>
</tbody>
</table>

**Considerations:**

- `temporalInstantValue` cannot be a Date value if `unit` is one of {hour, minute, second, millisecond, microsecond}.
- Any component that is provided in `mapOfComponents` must be less significant than `unit`; i.e. if `unit` is 'day', `mapOfComponents` cannot contain information pertaining to a month.
- Any component that is not contained in `mapOfComponents` and which is less significant than `unit` will be set to its minimal value.
- If `mapOfComponents` is not provided, all components of the returned value which are less significant than `unit` will be set to their default values.
- If `temporalInstantValue` is not provided, it will be set to the current date and time, i.e. `localdatetime.truncate(unit)` is equivalent of `localdatetime.truncate(unit, localdatetime())`.

**Query**

```sql
WITH localdatetime((year: 2017, month: 11, day: 11, hour: 12, minute: 31, second: 14, nanosecond: 645876123)) AS d
RETURN
localdatetime.truncate('millennium', d) AS truncMillenium,
localdatetime.truncate('year', d, (day: 2)) AS truncYear,
localdatetime.truncate('month', d) AS truncMonth,
localdatetime.truncate('day', d) AS truncDay,
localdatetime.truncate('hour', d, (nanosecond: 2)) AS truncHour,
localdatetime.truncate('second', d) AS truncSecond
```

10.9.5. LocalTime: `localtime()`

Details for using the `localtime()` function.

- Getting the current LocalTime
- Creating a LocalTime
- Creating a LocalTime from a string
- Creating a LocalTime using other temporal values as components
- Truncating a LocalTime

Getting the current LocalTime

`localtime()` returns the current LocalTime value. If no time zone parameter is specified, the local time zone will be used.

**Syntax:** `localtime([[timezone]])`

**Returns:**

A LocalTime.

**Arguments:**

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>A single map consisting of the following:</td>
<td></td>
</tr>
<tr>
<td>timezone</td>
<td>A string expression that represents the time zone</td>
</tr>
</tbody>
</table>

**Considerations:**

If no parameters are provided, `localtime()` must be invoked (`localtime({})` is invalid).

**Query**

```
RETURN localtime() AS now
```

The current local time (i.e. in the local time zone) is returned.

**Table 395. Result**

localtime.transaction()

`localtime.transaction()` returns the current `LocalTime` value using the `transaction` clock. This value will be the same for each invocation within the same transaction. However, a different value may be produced for different transactions.

**Syntax:** `localtime.transaction([timezone])`

**Returns:**

A `LocalTime`.

**Arguments:**

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>timezone</td>
<td>A string expression that represents the <code>timezone</code></td>
</tr>
</tbody>
</table>

**Query**

</tr>
</tbody>
</table>
localtime.statement() returns the current LocalTime value using the statement clock. This value will be the same for each invocation within the same statement. However, a different value may be produced for different statements within the same transaction.

Syntax: `localtime.statement([timezone])`

Returns:

A LocalTime.

Arguments:

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>timezone</td>
<td>A string expression that represents the time zone</td>
</tr>
</tbody>
</table>

Query

```

</tr>
</tbody>
</table>

localtime.realtime() returns the current LocalTime value using the realtime clock. This value will be the live clock of the system.

Syntax: `localtime.realtime([timezone])`

Returns:

A LocalTime.
Arguments:

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>timezone</td>
<td>A string expression that represents the time zone</td>
</tr>
</tbody>
</table>

Query

```
RETURN localtime().realtime() AS now
```

Table 400. Result

<thead>
<tr>
<th>now</th>
<th>13:05:32.163607</th>
</tr>
</thead>
<tbody>
<tr>
<td>Rows:</td>
<td>1</td>
</tr>
</tbody>
</table>

Creating a LocalTime

`localtime()` returns a LocalTime value with the specified hour, minute, second, millisecond, microsecond and nanosecond component values.

Syntax: `localtime([hour [, minute, second, millisecond, microsecond, nanosecond]])`

Returns:

A LocalTime.

Arguments:

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>A single map consisting of the following:</td>
<td></td>
</tr>
<tr>
<td>hour</td>
<td>An integer between 0 and 23 that specifies the hour of the day.</td>
</tr>
<tr>
<td>minute</td>
<td>An integer between 0 and 59 that specifies the number of minutes.</td>
</tr>
<tr>
<td>second</td>
<td>An integer between 0 and 59 that specifies the number of seconds.</td>
</tr>
<tr>
<td>millisecond</td>
<td>An integer between 0 and 999 that specifies the number of milliseconds.</td>
</tr>
<tr>
<td>microsecond</td>
<td>An integer between 0 and 999,999 that specifies the number of microseconds.</td>
</tr>
<tr>
<td>nanosecond</td>
<td>An integer between 0 and 999,999,999 that specifies the number of nanoseconds.</td>
</tr>
</tbody>
</table>

Considerations:

The hour component will default to 0 if `hour` is omitted.
The minute component will default to 0 if minute is omitted.

The second component will default to 0 if second is omitted.

Any missing millisecond, microsecond or nanosecond values will default to 0.

If millisecond, microsecond and nanosecond are given in combination (as part of the same set of parameters), the individual values must be in the range 0 to 999.

The least significant components in the set hour, minute, and second may be omitted; i.e. it is possible to specify only hour and minute, but specifying hour and second is not permitted.

One or more of millisecond, microsecond and nanosecond can only be specified as long as second is also specified.

Query

```
UNWIND [
  localtime({hour:12, minute:31, second:14, nanosecond: 789, millisecond: 123, microsecond: 456}),
  localtime({hour:12, minute:31, second:14}),
  localtime({hour:12})
] as theTime
RETURN theTime
```

Table 401. Result

<table>
<thead>
<tr>
<th>theTime</th>
</tr>
</thead>
<tbody>
<tr>
<td>12:31:14.123456789</td>
</tr>
<tr>
<td>12:31:14</td>
</tr>
<tr>
<td>12:00</td>
</tr>
</tbody>
</table>

Rows: 3

Creating a LocalTime from a string

`localtime()` returns the LocalTime value obtained by parsing a string representation of a temporal value.

**Syntax:** `localtime(temporalValue)`

**Returns:**

A LocalTime.

**Arguments:**

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>temporalValue</td>
<td>A string representing a temporal value.</td>
</tr>
</tbody>
</table>

**Considerations:**

- `temporalValue` must comply with the format defined for `times`.
- `temporalValue` must denote a valid time; i.e. a `temporalValue` denoting `13:46:64` is invalid.
- `localtime(null)` returns null.
Creating a LocalTime using other temporal values as components

`localtime()` returns the LocalTime value obtained by selecting and composing components from another temporal value. In essence, this allows a DateTime, LocalDateTime or Time value to be converted to a LocalTime, and for "missing" components to be provided.

**Syntax:** `localtime(time [, hour, ..., nanosecond])`

**Returns:**

A LocalTime.

**Arguments:**

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>A single map consisting of</td>
<td>A Time value.</td>
</tr>
<tr>
<td>the following:</td>
<td></td>
</tr>
<tr>
<td>time</td>
<td></td>
</tr>
<tr>
<td>hour</td>
<td>An integer between 0 and 23 that specifies the hour of the day.</td>
</tr>
<tr>
<td>minute</td>
<td>An integer between 0 and 59 that specifies the number of minutes.</td>
</tr>
<tr>
<td>second</td>
<td>An integer between 0 and 59 that specifies the number of seconds.</td>
</tr>
<tr>
<td>millisecond</td>
<td>An integer between 0 and 999 that specifies the number of milliseconds.</td>
</tr>
<tr>
<td>microsecond</td>
<td>An integer between 0 and 999,999 that specifies the number of microseconds.</td>
</tr>
<tr>
<td>Name</td>
<td>Description</td>
</tr>
<tr>
<td>--------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>nanosecond</td>
<td>An integer between 0 and 999,999,999 that specifies the number of nanoseconds.</td>
</tr>
</tbody>
</table>

**Considerations:**

If any of the optional parameters are provided, these will override the corresponding components of `time`.

`localtime(tt)` may be written instead of `localtime({time: tt})`.

**Query**

```sql
WITH time({hour: 12, minute: 31, second: 14, microsecond: 645876, timezone: '+01:00'}) AS tt
RETURN localtime({time: tt}) AS timeOnly,
    localtime({time: tt, second: 42}) AS timeSS
```

**Table 403. Result**

<table>
<thead>
<tr>
<th>timeOnly</th>
<th>timeSS</th>
</tr>
</thead>
<tbody>
<tr>
<td>12:31:14.645876</td>
<td>12:31:42.645876</td>
</tr>
</tbody>
</table>

**Rows: 1**

**Truncating a LocalTime**

`localtime.truncate()` returns the `LocalTime` value obtained by truncating a specified temporal instant value at the nearest preceding point in time at the specified component boundary (which is denoted by the truncation unit passed as a parameter to the function). In other words, the `LocalTime` returned will have all components that are less significant than the specified truncation unit set to their default values.

It is possible to supplement the truncated value by providing a map containing components which are less significant than the truncation unit. This will have the effect of overriding the default values which would otherwise have been set for these less significant components. For example, `minute` — with some value `x` — may be provided when the truncation unit is `hour` in order to ensure the returned value has the minute set to `x` instead of the default `minute` (which is `1`).

**Syntax:**

```sql
localtime.truncate(unit [, temporalInstantValue [, mapOfComponents ] ])
```

**Returns:**

A `LocalTime`.

**Arguments:**

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>unit</td>
<td>A string expression evaluating to one of the following: <code>{day, hour, minute, second, millisecond, microsecond}</code>.</td>
</tr>
<tr>
<td>temporalInstantValue</td>
<td>An expression of one of the following types: <code>{DateTime, LocalDateTime, Time, LocalTime}</code>.</td>
</tr>
<tr>
<td>Name</td>
<td>Description</td>
</tr>
<tr>
<td>--------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>mapOfComponents</td>
<td>An expression evaluating to a map containing components less significant than unit.</td>
</tr>
</tbody>
</table>

**Considerations:**

Truncating time to day — i.e. unit is 'day' — is supported, and yields midnight at the start of the day (00:00), regardless of the value of temporalInstantValue. However, the time zone of temporalInstantValue is retained.

Any component that is provided in mapOfComponents must be less significant than unit; i.e. if unit is 'second', mapOfComponents cannot contain information pertaining to a minute.

Any component that is not contained in mapOfComponents and which is less significant than unit will be set to its minimal value.

If mapOfComponents is not provided, all components of the returned value which are less significant than unit will be set to their default values.

If temporalInstantValue is not provided, it will be set to the current time, i.e. localtime.truncate(unit) is equivalent of localtime.truncate(unit, localtime()).

**Query**

```sql
WITH time(hour: 12, minute: 31, second: 14, nanosecond: 645876123, timezone: '-01:00') AS t
RETURN
localtime.truncate('day', t) AS truncDay,
localtime.truncate('hour', t) AS truncHour,
localtime.truncate('minute', t, {millisecond: 2}) AS truncMinute,
localtime.truncate('second', t) AS truncSecond,
localtime.truncate('millisecond', t) AS truncMillisecond,
localtime.truncate('microsecond', t) AS truncMicrosecond
```

**Table 404. Result**

<table>
<thead>
<tr>
<th>truncDay</th>
<th>truncHour</th>
<th>truncMinute</th>
<th>truncSecond</th>
<th>truncMillisecond</th>
<th>truncMicrosecond</th>
</tr>
</thead>
</table>

Rows: 1

**10.9.6. Time: time()**

Details for using the time() function.

- Getting the current Time
- Creating a Time
- Creating a Time from a string
- Creating a Time using other temporal values as components
- Truncating a Time

Getting the current Time

time() returns the current Time value. If no time zone parameter is specified, the local time zone will be
used.

Syntax: `time([],)`

Returns:

A Time.

Arguments:

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>A single map consisting of the following:</td>
<td></td>
</tr>
<tr>
<td>timezone</td>
<td>A string expression that represents the timezone</td>
</tr>
</tbody>
</table>

Considerations:

If no parameters are provided, `time()` must be invoked (`time([])` is invalid).

Query

```
RETURN time() AS currentTime
```

The current time of day using the local time zone is returned.

Table 405. Result

<table>
<thead>
<tr>
<th>currentTime</th>
</tr>
</thead>
<tbody>
<tr>

time.transaction()

`time.transaction()` returns the current Time value using the transaction clock. This value will be the same for each invocation within the same transaction. However, a different value may be produced for different transactions.
Syntax: `time.transaction([])`

Returns:
A Time.

Arguments:

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>timezone</td>
<td>A string expression that represents the time zone</td>
</tr>
</tbody>
</table>

Query

```

Rows: 1

Creating a Time

time() returns a Time value with the specified hour, minute, second, millisecond, microsecond, nanosecond and timezone component values.

Syntax: time([hour [, minute, second, millisecond, microsecond, nanosecond, timezone]])

Returns:

A Time.
Arguments:

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>A single map consisting of</td>
<td></td>
</tr>
<tr>
<td>the following:</td>
<td></td>
</tr>
<tr>
<td>hour</td>
<td>An integer between 0 and 23 that specifies the hour of the day.</td>
</tr>
<tr>
<td>minute</td>
<td>An integer between 0 and 59 that specifies the number of minutes.</td>
</tr>
<tr>
<td>second</td>
<td>An integer between 0 and 59 that specifies the number of seconds.</td>
</tr>
<tr>
<td>millisecond</td>
<td>An integer between 0 and 999 that specifies the number of milliseconds.</td>
</tr>
<tr>
<td>microsecond</td>
<td>An integer between 0 and 999,999 that specifies the number of microseconds.</td>
</tr>
<tr>
<td>nanosecond</td>
<td>An integer between 0 and 999,999,999 that specifies the number of nanoseconds.</td>
</tr>
<tr>
<td>timezone</td>
<td>An expression that specifies the time zone.</td>
</tr>
</tbody>
</table>

Considerations:

The hour component will default to 0 if hour is omitted.

The minute component will default to 0 if minute is omitted.

The second component will default to 0 if second is omitted.

Any missing millisecond, microsecond or nanosecond values will default to 0.

The timezone component will default to the configured default time zone if timezone is omitted.

If millisecond, microsecond and nanosecond are given in combination (as part of the same set of parameters), the individual values must be in the range 0 to 999.

The least significant components in the set hour, minute, and second may be omitted; i.e. it is possible to specify only hour and minute, but specifying hour and second is not permitted.

One or more of millisecond, microsecond and nanosecond can only be specified as long as second is also specified.

Query

```
UNWIND [
  time({hour: 12, minute: 31, second: 14, millisecond: 123, microsecond: 456, nanosecond: 789}),
  time({hour: 12, minute: 31, second: 14, nanosecond: 645876123}),
  time({hour: 12, minute: 31, second: 14, microsecond: 645876, timezone: '+01:00'}),
  time({hour: 12, minute: 31, timezone: '+01:00'})
] AS theTime
RETURN theTime
```

Table 411. Result

<table>
<thead>
<tr>
<th>theTime</th>
</tr>
</thead>
<tbody>
<tr>
<td>12:31:14.123456789Z</td>
</tr>
</tbody>
</table>
Creating a Time from a string

time() returns the Time value obtained by parsing a string representation of a temporal value.

Syntax: time(temporalValue)

Returns:
A Time.

Arguments:

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>temporalValue</td>
<td>A string representing a temporal value.</td>
</tr>
</tbody>
</table>

Considerations:

- temporalValue must comply with the format defined for times and time zones.
- The timezone component will default to the configured default time zone if it is omitted.
- temporalValue must denote a valid time; i.e. a temporalValue denoting 15:67 is invalid.
- time(null) returns null.

Query

```sql
UNWIND [time('21:40:32.142+01:00'), time('21:40:32.142Z'),
       time('21:40:32+01:00'),
       time('21:40-01:00'),
       time('2140-00:00'),
       time('2140-02'),
       time('22+18:00')]
AS theTime
RETURN theTime
```

Table 412. Result

<table>
<thead>
<tr>
<th>theTime</th>
</tr>
</thead>
<tbody>
<tr>
<td>21:40:32.142+01:00</td>
</tr>
<tr>
<td>21:40:32.142Z</td>
</tr>
</tbody>
</table>
Creating a Time using other temporal values as components

time() returns the Time value obtained by selecting and composing components from another temporal value. In essence, this allows a DateTime, LocalDateTime or LocalTime value to be converted to a Time, and for "missing" components to be provided.

Syntax: time({time [, hour, ... , timezone]})

Returns:

A Time.

Arguments:

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>A single map consisting of the following:</td>
<td></td>
</tr>
<tr>
<td>time</td>
<td>A Time value.</td>
</tr>
<tr>
<td>hour</td>
<td>An integer between 0 and 23 that specifies the hour of the day.</td>
</tr>
<tr>
<td>minute</td>
<td>An integer between 0 and 59 that specifies the number of minutes.</td>
</tr>
<tr>
<td>second</td>
<td>An integer between 0 and 59 that specifies the number of seconds.</td>
</tr>
<tr>
<td>millisecond</td>
<td>An integer between 0 and 999 that specifies the number of milliseconds.</td>
</tr>
<tr>
<td>microsecond</td>
<td>An integer between 0 and 999,999 that specifies the number of microseconds.</td>
</tr>
<tr>
<td>nanosecond</td>
<td>An integer between 0 and 999,999,999 that specifies the number of nanoseconds.</td>
</tr>
<tr>
<td>timezone</td>
<td>An expression that specifies the time zone.</td>
</tr>
</tbody>
</table>

Considerations:

If any of the optional parameters are provided, these will override the corresponding components of time.
time(tt) may be written instead of time({time: tt}).

Selecting a Time or DateTime value as the time component also selects its time zone. If a LocalTime or LocalDateTime is selected instead, the default time zone is used. In any case, the time zone can be overridden explicitly.

Selecting a DateTime or Time as the time component and overwriting the time zone will adjust the local time to keep the same point in time.

Query

```sql
WITH localtime({hour: 12, minute: 31, second: 14, microsecond: 645876}) AS tt
RETURN
  time({time: tt}) AS timeOnly,
  time({time: tt, timezone: '+05:00'}) AS timezone,
  time({time: tt, second: 42}) AS timeSS,
  time({time: tt, second: 42, timezone: '+05:00'}) AS timeSSTimezone
```

<table>
<thead>
<tr>
<th>timeOnly</th>
<th>timeZone</th>
<th>timeSS</th>
<th>timeSSTimezone</th>
</tr>
</thead>
</table>

Rows: 1

Truncating a Time

time.truncate() returns the Time value obtained by truncating a specified temporal instant value at the nearest preceding point in time at the specified component boundary (which is denoted by the truncation unit passed as a parameter to the function). In other words, the Time returned will have all components that are less significant than the specified truncation unit set to their default values.

It is possible to supplement the truncated value by providing a map containing components which are less significant than the truncation unit. This will have the effect of overriding the default values which would otherwise have been set for these less significant components. For example, minute — with some value x — may be provided when the truncation unit is hour in order to ensure the returned value has the minute set to x instead of the default minute (which is 1).

Syntax: `time.truncate(unit [, temporalInstantValue [, mapOfComponents ]])`

Returns:

A Time.

Arguments:

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>unit</td>
<td>A string expression evaluating to one of the following: {day, hour, minute, second, millisecond, microsecond}.</td>
</tr>
<tr>
<td>temporalInstantValue</td>
<td>An expression of one of the following types: {DateTime, LocalDateTime, Time, LocalTime}.</td>
</tr>
</tbody>
</table>
### Considerations:

Truncating time to day — i.e. unit is 'day' — is supported, and yields midnight at the start of the day (00:00), regardless of the value of `temporalInstantValue`. However, the time zone of `temporalInstantValue` is retained.

The time zone of `temporalInstantValue` may be overridden; for example, `time.truncate('minute', input, {timezone: '+0200'})`.

If `temporalInstantValue` is one of {Time, DateTime} — a value with a time zone — and the time zone is overridden, no time conversion occurs.

If `temporalInstantValue` is one of {LocalTime, LocalDateTime, Date} — a value without a time zone — and the time zone is not overridden, the configured default time zone will be used.

Any component that is provided in `mapOfComponents` must be less significant than unit; i.e. if unit is 'second', `mapOfComponents` cannot contain information pertaining to a minute.

Any component that is not contained in `mapOfComponents` and which is less significant than unit will be set to its minimal value.

If `mapOfComponents` is not provided, all components of the returned value which are less significant than unit will be set to their default values.

If `temporalInstantValue` is not provided, it will be set to the current time and timezone, i.e. `time.truncate(unit)` is equivalent of `time.truncate(unit, time())`.

**Query**

```cypher
WITH time({hour: 12, minute: 31, second: 14, nanosecond: 645876123, timezone: '-01:00'}) AS t
RETURN time.truncate('day', t) AS truncDay,
    time.truncate('hour', t) AS truncHour,
    time.truncate('minute', t) AS truncMinute,
    time.truncate('second', t) AS truncSecond,
    time.truncate('millisecond', t, {nanosecond: 2}) AS truncMillisecond,
    time.truncate('microsecond', t) AS truncMicrosecond
```

**Table 414. Result**

<table>
<thead>
<tr>
<th>truncDay</th>
<th>truncHour</th>
<th>truncMinute</th>
<th>truncSecond</th>
<th>truncMillisecond</th>
<th>truncMicrosecond</th>
</tr>
</thead>
<tbody>
<tr>
<td>00:00-01:00</td>
<td>12:00-01:00</td>

</tr>
</tbody>
</table>

Rows: 1

### 10.10. Temporal functions - duration

Cypher provides functions allowing for the creation and manipulation of values for a Duration temporal type.
duration():

- Creating a Duration from duration components
- Creating a Duration from a string
- Computing the Duration between two temporal instants

Information regarding specifying and accessing components of a Duration value can be found here.

10.10.1. Creating a Duration from duration components

duration() can construct a Duration from a map of its components in the same way as the temporal instant types.

- years
- quarters
- months
- weeks
- days
- hours
- minutes
- seconds
- milliseconds
- microseconds
- nanoseconds

Syntax: `duration([ {years, quarters, months, weeks, days, hours, minutes, seconds, milliseconds, microseconds, nanoseconds} ])`

Returns:

A Duration.

Arguments:

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>A single map consisting of the following:</td>
<td></td>
</tr>
<tr>
<td>years</td>
<td>A numeric expression.</td>
</tr>
<tr>
<td>quarters</td>
<td>A numeric expression.</td>
</tr>
<tr>
<td>months</td>
<td>A numeric expression.</td>
</tr>
<tr>
<td>weeks</td>
<td>A numeric expression.</td>
</tr>
<tr>
<td>Name</td>
<td>Description</td>
</tr>
<tr>
<td>---------------</td>
<td>------------------------------</td>
</tr>
<tr>
<td>days</td>
<td>A numeric expression.</td>
</tr>
<tr>
<td>hours</td>
<td>A numeric expression.</td>
</tr>
<tr>
<td>minutes</td>
<td>A numeric expression.</td>
</tr>
<tr>
<td>seconds</td>
<td>A numeric expression.</td>
</tr>
<tr>
<td>milliseconds</td>
<td>A numeric expression.</td>
</tr>
<tr>
<td>microseconds</td>
<td>A numeric expression.</td>
</tr>
<tr>
<td>nanoseconds</td>
<td>A numeric expression.</td>
</tr>
</tbody>
</table>

**Considerations:**

At least one parameter must be provided (duration() and duration({}) are invalid).

There is no constraint on how many of the parameters are provided.

It is possible to have a Duration where the amount of a smaller unit (e.g. seconds) exceeds the threshold of a larger unit (e.g. days).

The values of the parameters may be expressed as decimal fractions.

The values of the parameters may be arbitrarily large.

The values of the parameters may be negative.

**Query**

```plaintext
UNWIND [
  duration({days: 14, hours: 16, minutes: 12}),
  duration({months: 5, days: 1.5}),
  duration({months: 0.75}),
  duration({minutes: 1.5, seconds: 1, milliseconds: 123, microseconds: 456, nanoseconds: 789}),
  duration({minutes: 1.5, seconds: 1, nanoseconds: 123456789})
] AS aDuration
RETURN aDuration
```

**Table 415. Result**

<table>
<thead>
<tr>
<th>aDuration</th>
</tr>
</thead>
<tbody>
<tr>
<td>P14DT16H12M</td>
</tr>
<tr>
<td>PSM1DT12H</td>
</tr>
<tr>
<td>P22DT19H51M49.5S</td>
</tr>
<tr>
<td>P17DT12H</td>
</tr>
<tr>
<td>PT1M31.123456789S</td>
</tr>
<tr>
<td>PT1M31.123456789S</td>
</tr>
</tbody>
</table>

Rows: 6
10.10.2. Creating a Duration from a string

duration() returns the Duration value obtained by parsing a string representation of a temporal amount.

Syntax: duration(temporalAmount)

Returns:

A Duration.

Arguments:

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>temporalAmount</td>
<td>A string representing a temporal amount.</td>
</tr>
</tbody>
</table>

Considerations:

temporalAmount must comply with either the unit based form or date-and-time based form defined for Durations.

Query

```sql
UNWIND [
  duration("P14DT16H12M"),
  duration("P5M1.5D"),
  duration("P0.75M"),
  duration("PT0.75M"),
  duration("P2012-02-02T14:37:21.545")
] AS aDuration
RETURN aDuration
```

Table 416. Result

<table>
<thead>
<tr>
<th>aDuration</th>
</tr>
</thead>
<tbody>
<tr>
<td>P14DT16H12M</td>
</tr>
<tr>
<td>P5M1DT12H</td>
</tr>
<tr>
<td>P22DT19H51M49.5S</td>
</tr>
<tr>
<td>PT45S</td>
</tr>
<tr>
<td>P2012Y2M20DT14H37M21.545S</td>
</tr>
</tbody>
</table>

Rows: 5

10.10.3. Computing the Duration between two temporal instants

duration() has sub-functions which compute the logical difference (in days, months, etc) between two temporal instant values:

- duration.between(a, b): Computes the difference in multiple components between instant a and instant b. This captures month, days, seconds and sub-seconds differences separately.
- duration.inMonths(a, b): Computes the difference in whole months (or quarters or years) between instant a and instant b. This captures the difference as the total number of months. Any difference
smaller than a whole month is disregarded.

- \textit{duration.inDays(a, b)}: Computes the difference in whole days (or weeks) between instant \(a\) and instant \(b\). This captures the difference as the total number of days. Any difference smaller than a whole day is disregarded.

- \textit{duration.inSeconds(a, b)}: Computes the difference in seconds (and fractions of seconds, or minutes or hours) between instant \(a\) and instant \(b\). This captures the difference as the total number of seconds.

duration.between()

duration.between() returns the \textit{Duration} value equal to the difference between the two given instants.

**Syntax:** duration.between(instant, instant)

**Returns:** A Duration.

**Arguments:**

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>instant₁</td>
<td>An expression returning any temporal instant type (Date etc) that represents the starting instant.</td>
</tr>
<tr>
<td>instant₂</td>
<td>An expression returning any temporal instant type (Date etc) that represents the ending instant.</td>
</tr>
</tbody>
</table>

**Considerations:**

- If \(\text{instant}_2\) occurs earlier than \(\text{instant}_1\), the resulting Duration will be negative.
- If \(\text{instant}_1\) has a time component and \(\text{instant}_2\) does not, the time component of \(\text{instant}_1\) is assumed to be midnight, and vice versa.
- If \(\text{instant}_1\) has a time zone component and \(\text{instant}_2\) does not, the time zone component of \(\text{instant}_1\) is assumed to be the same as that of \(\text{instant}_2\), and vice versa.
- If \(\text{instant}_1\) has a date component and \(\text{instant}_2\) does not, the date component of \(\text{instant}_1\) is assumed to be the same as that of \(\text{instant}_2\), and vice versa.

**Query**

```
UNWIND [duration.between(date("1984-10-11"), date("1985-11-25")),
duration.between(date("1984-10-11"), date("1984-10-11")),
duration.between(date("1984-10-11"), datetime("1984-10-12T21:40:32.142+0100")),
duration.between(date("2015-06-24"), localtime("14:30")),
duration.between(localtime("14:30"), time("16:30+0100")),
duration.between(datetime({year: 2017, month: 10, day: 29, hour: 0, timezone: 'Europe/Stockholm'}),
datetime({year: 2017, month: 10, day: 29, hour: 0, timezone: 'Europe/London'}))] AS aDuration
RETURN aDuration
```

**Table 417. Result**

348
### duration.inMonths()

`duration.inMonths()` returns the Duration value equal to the difference in whole months, quarters or years between the two given instants.

**Syntax:** `duration.inMonths(instant_1, instant_2)`

**Returns:**

A Duration.

**Arguments:**

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>instant_1</td>
<td>An expression returning any temporal instant type (Date etc) that represents the starting instant.</td>
</tr>
<tr>
<td>instant_2</td>
<td>An expression returning any temporal instant type (Date etc) that represents the ending instant.</td>
</tr>
</tbody>
</table>

**Considerations:**

If `instant_1` occurs earlier than `instant_2`, the resulting Duration will be negative.

If `instant_1` has a time component and `instant_2` does not, the time component of `instant_1` is assumed to be midnight, and vice versa.

If `instant_1` has a time zone component and `instant_2` does not, the time zone component of `instant_1` is assumed to be the same as that of `instant_2`, and vice versa.

If `instant_1` has a date component and `instant_2` does not, the date component of `instant_1` is assumed to be the same as that of `instant_2`, and vice versa.

Any difference smaller than a whole month is disregarded.
duration.inDays() returns the Duration value equal to the difference in whole days or weeks between the two given instants.

Syntax: `duration.inDays(instant1, instant2)`

Returns:

A Duration.

Arguments:

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>instant1</td>
<td>An expression returning any temporal instant type (Date etc) that represents the starting instant.</td>
</tr>
<tr>
<td>instant2</td>
<td>An expression returning any temporal instant type (Date etc) that represents the ending instant.</td>
</tr>
</tbody>
</table>

Considerations:

- If `instant1` occurs earlier than `instant2`, the resulting Duration will be negative.
- If `instant1` has a time component and `instant2` does not, the time component of `instant1` is assumed to be midnight, and vice versa.
If `instant_1` has a time zone component and `instant_2` does not, the time zone component of `instant_2` is assumed to be the same as that of `instant_1`, and vice versa.

If `instant_1` has a date component and `instant_2` does not, the date component of `instant_2` is assumed to be the same as that of `instant_1`, and vice versa.

Any difference smaller than a whole day is disregarded.

Query

```
UNWIND
  duration.inDays(date("1984-10-11"), date("1985-11-25")),
  duration.inDays(date("1985-11-25"), date("1984-10-11")),
  duration.inDays(date("1984-10-11"), datetime("1984-10-12T21:40:32.142+0100")),
  duration.inDays(date("1985-11-25"), localdatetime("2015-06-24", "14:30")),
  duration.inDays(datetime({year: 2015, month: 10, day: 29}), datetime({year: 2017, month: 10, day: 29, hour: 0, timezone: 'Europe/Stockholm'}),
  datetime({year: 2017, month: 10, day: 29, hour: 0, timezone: 'Europe/London'}))
] AS aDuration
RETURN aDuration
```

10.11. Spatial functions

These functions are used to specify 2D or 3D points in a Coordinate Reference System (CRS) and to calculate the geodesic distance between two points.

Functions:

- \text{distance()}
- \text{point() - WGS 84 2D}
- \text{point() - WGS 84 3D}
- \text{point() - Cartesian 2D}
- \text{point() - Cartesian 3D}

The following graph is used for some of the examples below.
10.11.1. distance()

distance() returns a floating point number representing the geodesic distance between two points in the same Coordinate Reference System (CRS).

- If the points are in the Cartesian CRS (2D or 3D), then the units of the returned distance will be the same as the units of the points, calculated using Pythagoras' theorem.
- If the points are in the WGS-84 CRS (2D), then the units of the returned distance will be meters, based on the haversine formula over a spherical earth approximation.
- If the points are in the WGS-84 CRS (3D), then the units of the returned distance will be meters.
  
  ° The distance is calculated in two steps.
  
  ▪ First, a haversine formula over a spherical earth is used, at the average height of the two points.
  
  ▪ To account for the difference in height, Pythagoras' theorem is used, combining the previously calculated spherical distance with the height difference.

  ° This formula works well for points close to the earth's surface; for instance, it is well-suited for calculating the distance of an airplane flight. It is less suitable for greater heights, however, such as when calculating the distance between two satellites.

Syntax: distance(point1, point2)

Returns:

A Float.

Arguments:

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>point1</td>
<td>A point in either a geographic or cartesian coordinate system.</td>
</tr>
<tr>
<td>point2</td>
<td>A point in the same CRS as 'point1'.</td>
</tr>
</tbody>
</table>

Considerations:

distance(null, null), distance(null, point2) and distance(point1, null) all return null.
Attempting to use points with different Coordinate Reference Systems (such as WGS 84 2D and WGS 84 3D) will return null.

Query

```sql
WITH point({x: 2.3, y: 4.5, crs: 'cartesian'}) AS p1, point({x: 1.1, y: 5.4, crs: 'cartesian'}) AS p2
RETURN distance(p1, p2) AS dist
```

The distance between two 2D points in the Cartesian CRS is returned.

Table 421. Result

<table>
<thead>
<tr>
<th>dist</th>
</tr>
</thead>
<tbody>
<tr>
<td>1.5</td>
</tr>
</tbody>
</table>

Rows: 1

Query

```sql
WITH point({longitude: 12.78, latitude: 56.7, height: 100}) as p1, point({latitude: 56.71, longitude: 12.79, height: 100}) as p2
RETURN distance(p1, p2) as dist
```

The distance between two 3D points in the WGS 84 CRS is returned.

Table 422. Result

<table>
<thead>
<tr>
<th>dist</th>
</tr>
</thead>
<tbody>
<tr>
<td>1269.9148706779097</td>
</tr>
</tbody>
</table>

Rows: 1

Query

```sql
MATCH (t:TrainStation)-[:TRAVEL_ROUTE]->(o:Office)
WITH point({longitude: t.longitude, latitude: t.latitude}) AS trainPoint, point({longitude: o.longitude, latitude: o.latitude}) AS officePoint
RETURN round(distance(trainPoint, officePoint)) AS travelDistance
```

The distance between the train station in Copenhagen and the Neo4j office in Malmo is returned.

Table 423. Result

<table>
<thead>
<tr>
<th>travelDistance</th>
</tr>
</thead>
<tbody>
<tr>
<td>27842.0</td>
</tr>
</tbody>
</table>

Rows: 1

Query

```sql
RETURN distance(null, point({longitude: 56.7, latitude: 12.78})) AS d
```

If null is provided as one or both of the arguments, null is returned.
10.11.2. point() - WGS 84 2D

point({longitude | x, latitude | y [, crs][, srid]}) returns a 2D point in the WGS 84 CRS corresponding to the given coordinate values.

Syntax: point({longitude | x, latitude | y [, crs][, srid]})

Returns:
A 2D point in WGS 84.

Arguments:

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>A single map consisting of the following:</td>
<td></td>
</tr>
<tr>
<td>longitude/x</td>
<td>A numeric expression that represents the longitude/x value in decimal degrees</td>
</tr>
<tr>
<td>latitude/y</td>
<td>A numeric expression that represents the latitude/y value in decimal degrees</td>
</tr>
<tr>
<td>crs</td>
<td>The optional string 'WGS-84'</td>
</tr>
<tr>
<td>srid</td>
<td>The optional number 4326</td>
</tr>
</tbody>
</table>

Considerations:

If any argument provided to point() is null, null will be returned.

If the coordinates are specified using latitude and longitude, the crs or srid fields are optional and inferred to be 'WGS-84' (srid=4326).

If the coordinates are specified using x and y, then either the crs or srid field is required if a geographic CRS is desired.

Query

```
RETURN point({longitude: 56.7, latitude: 12.78}) AS point
```

A 2D point with a longitude of 56.7 and a latitude of 12.78 in the WGS 84 CRS is returned.
**Query**

```
RETURN point({x: 2.3, y: 4.5, crs: 'WGS-84'}) AS point
```

*x* and *y* coordinates may be used in the WGS 84 CRS instead of *longitude* and *latitude*, respectively, providing *crs* is set to 'WGS-84', or *srid* is set to 4326.

Table 426. Result

<table>
<thead>
<tr>
<th>point</th>
<th>point({x: 2.3, y: 4.5, crs: 'wgs-84'})</th>
</tr>
</thead>
<tbody>
<tr>
<td>Rows: 1</td>
<td></td>
</tr>
</tbody>
</table>

**Query**

```
MATCH (p:Office)
RETURN point({longitude: p.longitude, latitude: p.latitude}) AS officePoint
```

A 2D point representing the coordinates of the city of Malmo in the WGS 84 CRS is returned.

Table 427. Result

<table>
<thead>
<tr>
<th>officePoint</th>
<th>point({x: 12.994341, y: 55.611784, crs: 'wgs-84'})</th>
</tr>
</thead>
<tbody>
<tr>
<td>Rows: 1</td>
<td></td>
</tr>
</tbody>
</table>

**Query**

```
RETURN point(null) AS p
```

If *null* is provided as the argument, *null* is returned.

Table 428. Result

<table>
<thead>
<tr>
<th>p</th>
<th>&lt;null&gt;</th>
</tr>
</thead>
<tbody>
<tr>
<td>Rows: 1</td>
<td></td>
</tr>
</tbody>
</table>

**10.11.3. point() - WGS 84 3D**

```
point({longitude | x, latitude | y, height | z, [, crs][[, srid]])
```

returns a 3D point in the WGS 84 CRS corresponding to the given coordinate values.

**Syntax:** `point({longitude | x, latitude | y, height | z, [, crs][[, srid]])`

**Returns:**

A 3D point in WGS 84.
Arguments:

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>A single map consisting of the following:</td>
<td></td>
</tr>
<tr>
<td>longitude/x</td>
<td>A numeric expression that represents the longitude/x value in decimal degrees</td>
</tr>
<tr>
<td>latitude/y</td>
<td>A numeric expression that represents the latitude/y value in decimal degrees</td>
</tr>
<tr>
<td>height/z</td>
<td>A numeric expression that represents the height/z value in meters</td>
</tr>
<tr>
<td>crs</td>
<td>The optional string 'WGS-84-3D'</td>
</tr>
<tr>
<td>srid</td>
<td>The optional number 4979</td>
</tr>
</tbody>
</table>

Considerations:

If any argument provided to `point()` is `null`, `null` will be returned.

If the `height/z` key and value is not provided, a 2D point in the WGS 84 CRS will be returned.

If the coordinates are specified using `latitude` and `longitude`, the `crs` or `srid` fields are optional and inferred to be 'WGS-84-3D' (srid=4979).

If the coordinates are specified using `x` and `y`, then either the `crs` or `srid` field is required if a geographic CRS is desired.

Query

```sql
RETURN point({longitude: 56.7, latitude: 12.78, height: 8}) AS point
```

A 3D point with a longitude of 56.7, a latitude of 12.78 and a height of 8 meters in the WGS 84 CRS is returned.

Table 429. Result

<table>
<thead>
<tr>
<th>point</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>point({x: 56.7, y: 12.78, z: 8.0, crs: 'wgs-84-3d'})</code></td>
</tr>
<tr>
<td>Rows: 1</td>
</tr>
</tbody>
</table>

10.11.4. `point()` - Cartesian 2D

`point({x, y [, crs][, srid]})` returns a 2D point in the Cartesian CRS corresponding to the given coordinate values.

Syntax: `point({x, y [, crs][, srid]})`

Returns:

A 2D point in Cartesian.
Arguments:

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>A single map consisting of the following:</td>
<td></td>
</tr>
<tr>
<td>x</td>
<td>A numeric expression</td>
</tr>
<tr>
<td>y</td>
<td>A numeric expression</td>
</tr>
<tr>
<td>crs</td>
<td>The optional string 'cartesian'</td>
</tr>
<tr>
<td>srid</td>
<td>The optional number 7203</td>
</tr>
</tbody>
</table>

Considerations:

If any argument provided to point() is null, null will be returned.

The crs or srid fields are optional and default to the Cartesian CRS (which means srid:7203).

Query

```
RETURN point({x: 2.3, y: 4.5}) AS point
```

A 2D point with an x coordinate of 2.3 and a y coordinate of 4.5 in the Cartesian CRS is returned.

Table 430. Result

<table>
<thead>
<tr>
<th>point</th>
</tr>
</thead>
<tbody>
<tr>
<td>point({x: 2.3, y: 4.5, crs: 'cartesian'})</td>
</tr>
<tr>
<td>Rows: 1</td>
</tr>
</tbody>
</table>

10.11.5. point() - Cartesian 3D

point({x, y, z, [, crs][, srid]}) returns a 3D point in the Cartesian CRS corresponding to the given coordinate values.

Syntax: point({x, y, z, [, crs][, srid]})

Returns:

A 3D point in Cartesian.

Arguments:

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>A single map consisting of the following:</td>
<td></td>
</tr>
<tr>
<td>x</td>
<td>A numeric expression</td>
</tr>
<tr>
<td>y</td>
<td>A numeric expression</td>
</tr>
<tr>
<td>z</td>
<td>A numeric expression</td>
</tr>
<tr>
<td>Name</td>
<td>Description</td>
</tr>
<tr>
<td>------</td>
<td>-------------</td>
</tr>
<tr>
<td>crs</td>
<td>The optional string 'cartesian-3D'</td>
</tr>
<tr>
<td>srid</td>
<td>The optional number 9157</td>
</tr>
</tbody>
</table>

**Considerations:**

- If any argument provided to `point()` is `null`, `null` will be returned.
- If the `z` key and value is not provided, a 2D point in the Cartesian CRS will be returned.
- The `crs` or `srid` fields are optional and default to the 3D Cartesian CRS (which means `srid:9157`).

**Query**

```sql
RETURN point({x: 2.3, y: 4.5, z: 2}) AS point
```

A 3D point with an `x` coordinate of 2.3, a `y` coordinate of 4.5 and a `z` coordinate of 2 in the Cartesian CRS is returned.

**Table 431. Result**

<table>
<thead>
<tr>
<th>point</th>
</tr>
</thead>
<tbody>
<tr>
<td>point({x: 2.3, y: 4.5, z: 2.0, crs: 'cartesian-3d'})</td>
</tr>
</tbody>
</table>

**Rows: 1**

### 10.12. LOAD CSV functions

LOAD CSV functions can be used to get information about the file that is processed by LOAD CSV.

⚠️ The functions described on this page are only useful when run on a query that uses LOAD CSV. In all other contexts they will always return `null`.

**Functions:**

- `linenumber()`
- `file()`

### 10.12.1. linenumber()

`linenumber()` returns the line number that LOAD CSV is currently using.

**Syntax:** `linenumber()`

**Returns:**
Considerations:

null will be returned if this function is called without a LOAD CSV context.

If the CSV file contains headers, the headers will be linenumber 1 and the 1st row of data will have a linenumber of 2.

10.12.2. file()

file() returns the absolute path of the file that LOAD CSV is using.

Syntax: file()

Returns:

A String.

Considerations:

null will be returned if this function is called without a LOAD CSV context.

10.13. User-defined functions

User-defined functions are written in Java, deployed into the database and are called in the same way as any other Cypher function.

There are two main types of functions that can be developed and used:

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
<th>Usage</th>
<th>Developing</th>
</tr>
</thead>
<tbody>
<tr>
<td>Scalar</td>
<td>For each row the function takes parameters and returns a result</td>
<td>Using UDF</td>
<td>Extending Neo4j (UDF)</td>
</tr>
<tr>
<td>Aggregating</td>
<td>Consumes many rows and produces an aggregated result</td>
<td>Using aggregating UDF</td>
<td>Extending Neo4j (Aggregating UDF)</td>
</tr>
</tbody>
</table>

10.13.1. User-defined scalar functions

For each incoming row the function takes parameters and returns a single result.

This example shows how you invoke a user-defined function called join from Cypher.

Call a user-defined function

This calls the user-defined function org.neo4j.procedure.example.join().
Query

MATCH (n:Member) RETURN org.neo4j.function.example.join(collect(n.name)) AS members

Table 432. Result

<table>
<thead>
<tr>
<th>members</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;John,Paul,George,Ringo&quot;</td>
</tr>
</tbody>
</table>

Rows: 1

For developing and deploying user-defined functions in Neo4j, see Extending Neo4j → User-defined functions.
Chapter 11. User-defined aggregation functions

Aggregating functions consume many rows and produces a single aggregated result.

This example shows how you invoke a user-defined aggregation function called `longestString` from Cypher.

11.1. Call a user-defined aggregation function

This calls the user-defined function `org.neo4j.function.example.longestString()`.

Query

```cypher
MATCH (n:Member)
RETURN org.neo4j.function.example.longestString(n.name) AS member
```

Table 433. Result

<table>
<thead>
<tr>
<th>member</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;George&quot;</td>
</tr>
</tbody>
</table>

Rows: 1
Chapter 12. Indexes for search performance

This section explains how to manage indexes used for search performance.

This section describes how to manage indexes. For query performance purposes, it is important to also understand how the indexes are used by the Cypher planner. Refer to Query tuning for examples and in-depth discussions on how query plans result from different index and query scenarios. See specifically The use of indexes for examples of how various index scenarios result in different query plans.

For information on index configuration and limitations, refer to Operations Manual → Index configuration.

12.1. Indexes (types and limitations)

A database index is a redundant copy of some of the data in the database for the purpose of making searches of related data more efficient. This comes at the cost of additional storage space and slower writes, so deciding what to index and what not to index is an important and often non-trivial task.

Once an index has been created, it will be managed and kept up to date by the DBMS. Neo4j will automatically pick up and start using the index once it has been created and brought online.

Cypher enables the creation of indexes on one or more properties for all nodes or relationships that have a given label or relationship type:

- An index that is created on a single property for any given label or relationship type is called a single-property index.
- An index that is created on more than one property for any given label or relationship type is called a composite index.

Differences in the usage patterns between composite and single-property indexes are described in Composite index limitations.

The following is true for indexes:

- Best practice is to give the index a name when it is created. If the index is not explicitly named, it will get an auto-generated name.
- The index name must be unique among both indexes and constraints.
- Index creation is by default not idempotent, and an error will be thrown if you attempt to create the same index twice. Using the keyword IF NOT EXISTS makes the command idempotent, and no error will be thrown if you attempt to create the same index twice.

12.1.1. Syntax

Table 434. Syntax for managing indexes
<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
<th>Comment</th>
</tr>
</thead>
<tbody>
<tr>
<td>CREATE [BTREE] INDEX [index_name] [IF NOT EXISTS] FOR (n:LabelName) ON (n.propertyName) [OPTIONS &quot;{&quot; option: value[, ...] &quot;}&quot;]</td>
<td>Create a single-property index on nodes. Index provider and configuration can be specified using the OPTIONS clause.</td>
<td>Best practice is to give the index a name when it is created. If the index is not explicitly named, it will get an auto-generated name.</td>
</tr>
<tr>
<td>CREATE [BTREE] INDEX [index_name] [IF NOT EXISTS] FOR ()-&quot;[r:TYPE_NAME&quot;]&quot;-() ON (r.propertyName) [OPTIONS &quot;{&quot; option: value[, ...] &quot;}&quot;]</td>
<td>Create a single-property index on relationships. Index provider and configuration can be specified using the OPTIONS clause.</td>
<td>The index name must be unique among both indexes and constraints. The command is optionally idempotent, with the default behavior to throw an error if you attempt to create the same index twice. With IF NOT EXISTS, no error is thrown and nothing happens should an index with the same name, schema or both already exist. It may still throw an error if conflicting constraints exist, such as constraints with the same name or schema.</td>
</tr>
<tr>
<td>CREATE [BTREE] INDEX [index_name] [IF NOT EXISTS] FOR (n:LabelName) ON (n.propertyName_1, n.propertyName_2, ..., n.propertyName_n) [OPTIONS &quot;{&quot; option: value[, ...] &quot;}&quot;]</td>
<td>Create a composite index on nodes. Index provider and configuration can be specified using the OPTIONS clause.</td>
<td></td>
</tr>
<tr>
<td>CREATE [BTREE] INDEX [index_name] [IF NOT EXISTS] FOR ()-&quot;[r:TYPE_NAME&quot;]&quot;-() ON (r.propertyName_1, r.propertyName_2, ..., r.propertyName_n) [OPTIONS &quot;{&quot; option: value[, ...] &quot;}&quot;]</td>
<td>Create a composite index on relationships. Index provider and configuration can be specified using the OPTIONS clause.</td>
<td></td>
</tr>
<tr>
<td>CREATE LOOKUP INDEX [index_name] [IF NOT EXISTS] FOR EACH labels(n)</td>
<td>Create a node label lookup index. Token lookup indexes do not support any OPTIONS values.</td>
<td></td>
</tr>
<tr>
<td>CREATE LOOKUP INDEX [index_name] [IF NOT EXISTS] FOR ()-&quot;[r:TYPE_NAME&quot;]&quot;-()</td>
<td>Create a relationship type lookup index. Token lookup indexes do not support any OPTIONS values.</td>
<td></td>
</tr>
<tr>
<td>DROP INDEX index_name [IF EXISTS]</td>
<td>Drop an index, either a b-tree, fulltext, or token lookup index.</td>
<td>The command is optionally idempotent, with the default behavior to throw an error if you attempt to drop the same index twice. With IF EXISTS, no error is thrown and nothing happens should the index not exist.</td>
</tr>
<tr>
<td>Command</td>
<td>Description</td>
<td>Comment</td>
</tr>
<tr>
<td>---------</td>
<td>-------------</td>
<td>---------</td>
</tr>
<tr>
<td>**SHOW [ALL</td>
<td>BTREE</td>
<td>FULLTEXT</td>
</tr>
<tr>
<td><img src="SHOW.png" alt="Command" /></td>
<td><img src="SHOW.png" alt="Description" /></td>
<td><img src="SHOW.png" alt="Comment" /></td>
</tr>
<tr>
<td><strong>DROP INDEX ON :LabelName(propertyName)</strong></td>
<td>Drop a single-property index on nodes without specifying a name.</td>
<td>This syntax is deprecated.</td>
</tr>
<tr>
<td><img src="DROP.png" alt="Command" /></td>
<td><img src="DROP.png" alt="Description" /></td>
<td><img src="DROP.png" alt="Comment" /></td>
</tr>
<tr>
<td><strong>DROP INDEX ON :LabelName (n.propertyName_1, n.propertyName_2, ..., n.propertyName_n)</strong></td>
<td>Drop a composite index on nodes without specifying a name.</td>
<td></td>
</tr>
<tr>
<td><img src="DROP.png" alt="Command" /></td>
<td><img src="DROP.png" alt="Description" /></td>
<td></td>
</tr>
</tbody>
</table>

Creating an index requires the **CREATE INDEX privilege**, while dropping an index requires the **DROP INDEX privilege** and listing indexes require the **SHOW INDEX privilege**.

Planner hints and the **USING** keyword describes how to make the Cypher planner use specific indexes (especially in cases where the planner would not necessarily have used them).

### 12.1.2. Composite index limitations

Like single-property indexes, composite indexes support all predicates:

- equality check: `n.prop = value`
- list membership check: `n.prop IN list`
- existence check: `n.prop IS NOT NULL`
- range search: `n.prop > value`
- prefix search: `STARTS WITH`
- suffix search: `ENDS WITH`
- substring search: `CONTAINS`

- For details about each operator, see [Operators](#).

However, predicates might be planned as existence check and a filter. For most predicates, this can be avoided by following these restrictions:

- If there is any **equality check** and **list membership check** predicates, they need to be for the first properties defined by the index.
- There can be up to one **range search** or **prefix search** predicate.
- There can be any number of **existence check** predicates.
- Any predicate after a **range search**, **prefix search** or **existence check** predicate has to be an
existence check predicate.

However, the suffix search and substring search predicates are always planned as existence check and a filter and any predicates following after will therefore also be planned as such.

For example, an index on nodes with :Label(prop1,prop2,prop3,prop4,prop5,prop6) and predicates:

```
WHERE n.prop1 = 'x' AND n.prop2 = 1 AND n.prop3 > 5 AND n.prop4 < 'e' AND n.prop5 = true AND n.prop6 IS NOT NULL
```

will be planned as:

```
WHERE n.prop1 = 'x' AND n.prop2 = 1 AND n.prop3 > 5 AND n.prop4 IS NOT NULL AND n.prop5 IS NOT NULL AND n.prop6 IS NOT NULL
```

with filters on n.prop4 < 'e' and n.prop5 = true, since n.prop3 has a range search predicate.

And an index on nodes with :Label(prop1,prop2) with predicates:

```
WHERE n.prop1 ENDS WITH 'x' AND n.prop2 = false
```

will be planned as:

```
WHERE n.prop1 IS NOT NULL AND n.prop2 IS NOT NULL
```

with filters on n.prop1 ENDS WITH 'x' and n.prop2 = false, since n.prop1 has a suffix search predicate.

Composite indexes require predicates on all properties indexed. If there are predicates on only a subset of the indexed properties, it will not be possible to use the composite index. To get this kind of fallback behavior, it is necessary to create additional indexes on the relevant sub-set of properties or on single properties.

12.2. Creating indexes

12.2.1. Create a single-property index for nodes

A named index on a single property for all nodes that have a particular label can be created with `CREATE INDEX index_name FOR (n:Label) ON (n.property)`. Note that the index is not immediately available, but is created in the background.

**Query**

```
CREATE INDEX node_index_name FOR (n:Person) ON (n.surname)
```

Note that the index name needs to be unique.
12.3. Create a single-property index for relationships

A named index on a single property for all relationships that have a particular relationship type can be created with `CREATE INDEX index_name FOR ()-[r:TYPE]-() ON (r.property)`. Note that the index is not immediately available, but is created in the background.

Query

```sql
CREATE INDEX rel_index_name FOR ()-[r:KNOWS]-() ON (r.since)
```

Note that the index name needs to be unique.

Result

```
<table>
<thead>
<tr>
<th>No data returned.</th>
</tr>
</thead>
</table>
Indexes added: 1
```

12.4. Create a single-property index only if it does not already exist

If it is unknown if an index exists or not but we want to make sure it does, we add `IF NOT EXISTS`.

Query

```sql
CREATE INDEX node_index_name IF NOT EXISTS FOR (n:Person) ON (n.surname)
```

Note that the index will not be created if there already exists an index with the same name, same schema or both.

Result

```
<table>
<thead>
<tr>
<th>No data returned, and nothing was changed.</th>
</tr>
</thead>
</table>
```

12.5. Create a single-property index with specified index provider

To create a single property index with a specific index provider, the `OPTIONS clause is used. Valid values for the index provider is `native-btree-1.0` and `lucene+native-3.0`, default if nothing is specified is `native-btree-1.0`.
Query

```sql
CREATE BTREE INDEX index_with_provider FOR ()-[r:TYPE]-() ON (r.prop1) OPTIONS {indexProvider: 'native-btree-1.0'}
```

Can be combined with specifying index configuration.

Result

```
<table>
<thead>
<tr>
<th>No data returned.</th>
</tr>
</thead>
</table>
Indexes added: 1
```

12.6. Create a single-property index with specified index configuration

To create a single property index with a specific index configuration, the OPTIONS clause is used. Valid configuration settings are `spatial.cartesian.min`, `spatial.cartesian.max`, `spatial.cartesian-3d.min`, `spatial.cartesian-3d.max`, `spatial.wgs-84.min`, `spatial.wgs-84.max`, `spatial.wgs-84-3d.min`, and `spatial.wgs-84-3d.max`. Non-specified settings get their respective default values.

Query

```sql
CREATE BTREE INDEX index_with_config FOR (n:Label) ON (n.prop2) OPTIONS {indexConfig: {'spatial.cartesian.min': [-100.0, -100.0], 'spatial.cartesian.max': [100.0, 100.0]}}
```

Can be combined with specifying index provider.

Result

```
<table>
<thead>
<tr>
<th>No data returned.</th>
</tr>
</thead>
</table>
Indexes added: 1
```

12.7. Create a composite index for nodes

A named index on multiple properties for all nodes that have a particular label — i.e. a composite index — can be created with `CREATE INDEX index_name FOR (n:Label) ON (n.prop1, ..., n.propN)`. Only nodes labeled with the specified label and which contain all the properties in the index definition will be added to the index. Note that the composite index is not immediately available, but is created in the background. The following statement will create a named composite index on all nodes labeled with `Person` and which have both an `age` and `country` property:

Query

```sql
CREATE INDEX node_index_name FOR (n:Person) ON (n.age, n.country)
```

Note that the index name needs to be unique.
12.8. Create a composite index for relationships

A named index on multiple properties for all relationships that have a particular relationship type — i.e. a composite index — can be created with `CREATE INDEX index_name FOR ()-[r:TYPE]-() ON (r.prop1, ..., r.propN)`. Only relationships labeled with the specified type and which contain all the properties in the index definition will be added to the index. Note that the composite index is not immediately available, but is created in the background. The following statement will create a named composite index on all relationships labeled with `PURCHASED` and which have both a `date` and `amount` property:

**Query**

```
CREATE INDEX rel_index_name FOR ()-[r:PURCHASED]-() ON (r.date, r.amount)
```

Note that the index name needs to be unique.

**Result**

```
<table>
<thead>
<tr>
<th>No data returned.</th>
</tr>
</thead>
</table>
Indexes added: 1
```

12.9. Create a composite index with specified index provider and configuration

To create a composite index with a specific index provider and configuration, the `OPTIONS` clause is used. Valid values for the index provider is `native-btree-1.0` and `lucene+native-3.0`, default if nothing is specified is `native-btree-1.0`. Valid configuration settings are `spatial.cartesian.min`, `spatial.cartesian.max`, `spatial.cartesian-3d.min`, `spatial.cartesian-3d.max`, `spatial.wgs-84.min`, `spatial.wgs-84.max`, `spatial.wgs-84-3d.min`, and `spatial.wgs-84-3d.max`. Non-specified settings get their respective default values.

**Query**

```
CREATE INDEX index_with_options FOR (n:Label) ON (n.prop1, n.prop2)
OPTIONS {
  indexProvider: 'lucene+native-3.0',
  indexConfig: {'spatial.wgs-84.min': [-100.0, -80.0], 'spatial.wgs-84.max': [100.0, 80.0]}
}
```

Specifying index provider and configuration can be done individually.
12.10. Create a node label lookup index

A named token lookup index for all nodes with one or more labels can be created with `CREATE LOOKUP INDEX index_name FOR (n) ON EACH labels(n)`. Note that the index is not immediately available, but is created in the background.

**Query**

```sql
CREATE LOOKUP INDEX node_label_lookup_index FOR (n) ON EACH labels(n)
```

Note that it can only be created once and that the index name must be unique.

**Result**

<table>
<thead>
<tr>
<th>No data returned.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Indexes added: 1</td>
</tr>
</tbody>
</table>

12.11. Create a relationship type lookup index

A named token lookup index for all relationships with any relationship type can be created with `CREATE LOOKUP INDEX index_name FOR ()-[r]-() ON EACH type(r)`. Note that the index is not immediately available, but is created in the background.

**Query**

```sql
CREATE LOOKUP INDEX rel_type_lookup_index FOR ()-[r]-() ON EACH type(r)
```

Note that it can only be created once and that the index name must be unique.

**Result**

<table>
<thead>
<tr>
<th>No data returned.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Indexes added: 1</td>
</tr>
</tbody>
</table>
Chapter 13. Listing indexes

Listing indexes can be done with `SHOW INDEXES`, which will produce a table with the following columns:

Table 435. List indexes output

<table>
<thead>
<tr>
<th>Column</th>
<th>Description</th>
<th>Default output</th>
<th>Full output</th>
</tr>
</thead>
<tbody>
<tr>
<td>id</td>
<td>The id of the index.</td>
<td>+</td>
<td>+</td>
</tr>
<tr>
<td>name</td>
<td>Name of the index (explicitly set by the user or automatically assigned).</td>
<td>+</td>
<td>+</td>
</tr>
<tr>
<td>state</td>
<td>Current state of the index.</td>
<td>+</td>
<td>+</td>
</tr>
<tr>
<td>populationPercent</td>
<td>% of index population.</td>

</tbody>
</table>

Listing indexes also allows for `WHERE` and `YIELD` clauses to filter the returned rows and columns.

The deprecated built-in procedures for listing indexes, such as `db.indexes`, work as before and are not affected by the `SHOW INDEXES` privilege.
13.1. Listing indexes examples

13.1.1. Listing all indexes

To list all indexes with the default output columns, the SHOW INDEXES command can be used. If all columns are required, use SHOW INDEXES YIELD *.

Query

```
SHOW INDEXES
```

One of the output columns from SHOW INDEXES is the name of the index. This can be used to drop the index with the DROP INDEX command.

Result

```
+---------------------------------------+---------------------------------------+| id | name             | state    | populationPercent | uniqueness | type    | entityType |
|------------------------------|---------------------------------------+---------------------------------------+---------------------------------------+---------------------------------------+---------------------------------------+| 3  | "index_d7c12ba3" | "ONLINE" | 100.0             | "NONUNIQUE" | "BTREE" | "NODE"     |
| "highScore" | "native-btree-1.0" |
| 4  | "index_58a1c03e" | "ONLINE" | 100.0             | "NONUNIQUE" | "BTREE" | "NODE"     |
| "location" | "native-btree-1.0" |
| 5  | "index_deeafdb2" | "ONLINE" | 100.0             | "NONUNIQUE" | "BTREE" | "NODE"     |
| "firstname" | "native-btree-1.0" |
| 3  | "index_deeafdb2" | "ONLINE" | 100.0             | "NONUNIQUE" | "BTREE" | "NODE"     |
| "firstname" | "native-btree-1.0" |
+---------------------------------------+---------------------------------------+| 4  | "index_58a1c03e" | "ONLINE" | 100.0             | "NONUNIQUE" | "BTREE" | "NODE"     |
| "location" | "native-btree-1.0" |
| 5  | "index_d7c12ba3" | "ONLINE" | 100.0             | "NONUNIQUE" | "BTREE" | "NODE"     |
| "highScore" | "native-btree-1.0" |

| "firstname" | "native-btree-1.0" |
3 rows
```

13.1.2. Listing indexes with filtering

One way of filtering the output from SHOW INDEXES by index type is the use of type keywords, listed in the syntax table. For example, to show only b-tree indexes, use SHOW BTREE INDEXES. Another more flexible way of filtering the output is to use the WHERE clause. An example is to only show indexes not belonging to constraints.

Query

```
SHOW BTREE INDEXES WHERE uniqueness = 'NONUNIQUE'
```

This will only return the default output columns. To get all columns, use SHOW INDEXES YIELD * WHERE ...
<table>
<thead>
<tr>
<th>id</th>
<th>name</th>

Chapter 14. Deleting indexes

14.1. Drop an index

An index can be dropped using the name with the `DROP INDEX index_name` command. This command can drop b-tree, fulltext, or token lookup indexes. The name of the index can be found using the `SHOW INDEXES` command, given in the output column `name`.

Query

```
DROP INDEX index_name
```

Result

```
+-------------------+
| No data returned. |
| Indexes removed: 1 |
+-------------------+
```

14.2. Drop a non-existing index

If it is uncertain if an index exists and you want to drop it if it does but not get an error should it not, use:

Query

```
DROP INDEX missing_index_name IF EXISTS
```

Result

```
+--------------------------------------------+
| No data returned, and nothing was changed. |
+--------------------------------------------+
```
Chapter 15. Deprecated syntax

This syntax does not support dropping relationship property indexes, these can only be dropped by name.

15.1. Drop a single-property index

An index on all nodes that have a label and single property combination can be dropped with `DROP INDEX ON :Label(property)`.

Query

```
DROP INDEX ON :Person(firstname)
```

Result

```
+-------------------+
| No data returned. |
| Indexes removed: 1 |
```

15.2. Drop a composite index

A composite index on all nodes that have a label and multiple property combination can be dropped with `DROP INDEX ON :Label(prop1, ..., propN)`. The following statement will drop a composite index on all nodes labeled with `Person` and which have both an `age` and `country` property:

Query

```
DROP INDEX ON :Person(age, country)
```

Result

```
+-------------------+
| No data returned. |
| Indexes removed: 1 |
```
Chapter 16. Full-text search index

This chapter describes how to use full-text indexes, to enable full-text search.

Full-text indexes are powered by the Apache Lucene indexing and search library, and can be used to index nodes and relationships by string properties. A full-text index allows you to write queries that match within the contents of indexed string properties. For instance, the b-tree indexes described in previous sections can only do exact matching or prefix matches on strings. A full-text index will instead tokenize the indexed string values, so it can match terms anywhere within the strings. How the indexed strings are tokenized and broken into terms, is determined by what analyzer the full-text index is configured with. For instance, the swedish analyzer knows how to tokenize and stem Swedish words, and will avoid indexing Swedish stop words. The complete list of stop words for each analyzer is included in the result of the db.index.fulltext.listAvailableAnalyzers procedure.

Full-text indexes:

- support the indexing of both nodes and relationships.
- support configuring custom analyzers, including analyzers that are not included with Lucene itself.
- can be queried using the Lucene query language.
- can return the score for each result from a query.
- are kept up to date automatically, as nodes and relationships are added, removed, and modified.
- will automatically populate newly created indexes with the existing data in a store.
- can be checked by the consistency checker, and they can be rebuilt if there is a problem with them.
- are a projection of the store, and can only index nodes and relationships by the contents of their properties.
- can support any number of documents in a single index.
- are created, dropped, and updated transactionally, and is automatically replicated throughout a cluster.
- can be accessed via Cypher procedures.
- can be configured to be eventually consistent, in which index updating is moved from the commit path to a background thread. Using this feature, it is possible to work around the slow Lucene writes from the performance critical commit process, thus removing the main bottlenecks for Neo4j write performance.

At first sight, the construction of full-text indexes can seem similar to regular indexes. However there are some things that are interesting to note: In contrast to b-tree indexes, a full-text index can be:

- applied to more than one label.
- applied to more than one relationship type.
- applied to more than one property at a time (similar to a composite index) but with an important difference: While a composite index applies only to entities that match the indexed label and all of the indexed properties, full-text index will index entities that have at least one of the indexed labels or relationship types, and at least one of the indexed properties.
For information on how to configure full-text indexes, refer to Operations Manual → Indexes to support full-text search.

16.1. Full-text search procedures

Full-text indexes are managed through commands and used through built-in procedures, see Operations Manual → Procedures for a complete reference.

The commands and procedures for full-text indexes are listed in the table below:

<table>
<thead>
<tr>
<th>Usage</th>
<th>Procedure/Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Create full-text node index</td>
<td>CREATE FULLTEXT INDEX ...</td>
<td>Create a node fulltext index for the given labels and properties. The optional 'options' map can be used to supply provider and settings to the index. Supported settings are 'fulltext.analyzer', for specifying what analyzer to use when indexing and querying. Use the db.index.fulltext.listAvailableAnalyzers procedure to see what options are available. And 'fulltext.eventually_consistent' which can be set to 'true' to make this index eventually consistent, such that updates from committing transactions are applied in a background thread.</td>
</tr>
<tr>
<td>Create full-text relationship index</td>
<td>CREATE FULLTEXT INDEX ...</td>
<td>Create a relationship fulltext index for the given relationship types and properties. The optional 'options' map can be used to supply provider and settings to the index. Supported settings are 'fulltext.analyzer', for specifying what analyzer to use when indexing and querying. Use the db.index.fulltext.listAvailableAnalyzers procedure to see what options are available. And 'fulltext.eventually_consistent' which can be set to 'true' to make this index eventually consistent, such that updates from committing transactions are applied in a background thread.</td>
</tr>
<tr>
<td>List available analyzers</td>
<td>db.index.fulltext.listAvailableAnalyzers</td>
<td>List the available analyzers that the full-text indexes can be configured with.</td>
</tr>
<tr>
<td>Use full-text node index</td>
<td>db.index.fulltext.queryNodes</td>
<td>Query the given full-text index. Returns the matching nodes and their Lucene query score, ordered by score.</td>
</tr>
<tr>
<td>Use full-text relationship index</td>
<td>db.index.fulltext.queryRelationships</td>
<td>Query the given full-text index. Returns the matching relationships and their Lucene query score, ordered by score.</td>
</tr>
</tbody>
</table>
16.2. Create and configure full-text indexes

Full-text indexes are created with the `CREATE FULLTEXT INDEX` command. An index can be given a unique name when created (or get a generated one), which is used to reference the specific index when querying or dropping it. A full-text index applies to a list of labels or a list of relationship types, for node and relationship indexes respectively, and then a list of property names.

Table 436. Syntax for creating fulltext indexes

<table>
<thead>
<tr>
<th>Usage</th>
<th>Procedure/Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Drop full-text index</td>
<td>DROP INDEX _</td>
<td>Drop the specified index.</td>
</tr>
<tr>
<td>Eventually consistent indexes</td>
<td><code>db.index.fulltext.awaitEventuallyConsistentIndexRefresh</code></td>
<td>Wait for the updates from recently committed transactions to be applied to any eventually-consistent full-text indexes.</td>
</tr>
<tr>
<td>Listing all fulltext indexes</td>
<td><code>SHOW FULLTEXT INDEXES</code></td>
<td>Lists all fulltext indexes, see the <code>SHOW INDEXES</code> command for details.</td>
</tr>
<tr>
<td>Command</td>
<td>Description</td>
<td>Comment</td>
</tr>
<tr>
<td>---------</td>
<td>-------------</td>
<td>---------</td>
</tr>
<tr>
<td>CREATE FULLTEXT INDEX [index_name] [IF NOT EXISTS] FOR (n:LabelName[*] ...) ON EACH &quot;[&quot; n.propertyName[,,] &quot;]&quot; [OPTIONS &quot;{&quot; option: value[,,] &quot;]&quot;]</td>
<td>Create a fulltext index on nodes.</td>
<td>Best practice is to give the index a name when it is created. This name is needed for both dropping and querying the index. If the index is not explicitly named, it will get an auto-generated name. The index name must be unique among all indexes and constraints. Index provider and configuration can be specified using the OPTIONS clause. The command is optionally idempotent, with the default behavior to throw an error if you attempt to create the same index twice. With IF NOT EXISTS, no error is thrown and nothing happens should an index with the same name, schema or both already exist. It may still throw an error should a constraint with the same name exist.</td>
</tr>
<tr>
<td>CREATE FULLTEXT INDEX [index_name] [IF NOT EXISTS] FOR ()-&quot;[r:TYPE_NAME[*] ...]&quot;-() ON EACH &quot;[&quot; r.propertyName[,,] &quot;]&quot; [OPTIONS &quot;{&quot; option: value[,,] &quot;]&quot;]</td>
<td>Create a fulltext index on relationships.</td>
<td></td>
</tr>
</tbody>
</table>

For instance, if we have a movie with a title.

Query

```
CREATE (m:Movie {title: "The Matrix"}) RETURN m.title
```

Table 437. Result

<table>
<thead>
<tr>
<th>m.title</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;The Matrix&quot;</td>
<td></td>
</tr>
</tbody>
</table>

Rows: 1
Nodes created: 1
Properties set: 1
Labels added: 1
And we have a full-text index on the title and description properties of movies and books.

Query

```sql
CREATE FULLTEXT INDEX titlesAndDescriptions FOR (n:Movie|Book) ON EACH [n.title, n.description]
```

Then our movie node from above will be included in the index, even though it only has one of the indexed labels, and only one of the indexed properties:

Query

```sql
CALL db.index.fulltext.queryNodes("titlesAndDescriptions", "matrix") YIELD node, score
RETURN node.title, node.description, score
```

Table 438. Result

<table>
<thead>
<tr>
<th>node.title</th>
<th>node.description</th>
<th>score</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;The Matrix&quot;</td>
<td>&lt;null&gt;</td>
<td>0.7799721956253052</td>
</tr>
</tbody>
</table>

The same is true for full-text indexes on relationships. Though a relationship can only have one type, a relationship full-text index can index multiple types, and all relationships will be included that match one of the relationship types, and at least one of the indexed properties.

The CREATE FULLTEXT INDEX command take an optional clause, called options. This have two parts, the indexProvider and indexConfig. The provider can only have the default value, 'fulltext-1.0'. The indexConfig is a map from string to string and booleans, and can be used to set index-specific configuration settings. The fulltext.analyzer setting can be used to configure an index-specific analyzer. The possible values for the fulltext.analyzer setting can be listed with the db.index.fulltext.listAvailableAnalyzers procedure. The fulltext.eventually_consistent setting, if set to true, will put the index in an eventually consistent update mode. This means that updates will be applied in a background thread "as soon as possible", instead of during transaction commit like other indexes.

Query

```sql
CREATE FULLTEXT INDEX taggedByRelationshipIndex FOR ()-[r:TAGGED_AS]-() ON EACH [r.taggedByUser] OPTIONS (indexConfig: {'fulltext.analyzer': 'url_or_email', 'fulltext.eventually_consistent': true})
```

In this example, an eventually consistent relationship full-text index is created for the TAGGED_AS relationship type, and the taggedByUser property, and the index uses the url_or_email analyzer. This could, for instance, be a system where people are assigning tags to documents, and where the index on the taggedByUser property will allow them to quickly find all of the documents they have tagged. Had it not been for the relationship index, one would have had to add artificial connective nodes between the tags and the documents in the data model, just so these nodes could be indexed.

Table 439. Result

(Empty result)
16.3. Query full-text indexes

Full-text indexes will, in addition to any exact matches, also return approximate matches to a given query. Both the property values that are indexed, and the queries to the index, are processed through the analyzer such that the index can find that don't exactly matches. The score that is returned alongside each result entry, represents how well the index thinks that entry matches the given query. The results are always returned in descending score order, where the best matching result entry is put first. To illustrate, in the example below, we search our movie database for "Full Metal Jacket", and even though there is an exact match as the first result, we also get three other less interesting results:

Query

```sql
CALL db.index.fulltext.queryNodes("titlesAndDescriptions", "Full Metal Jacket") YIELD node, score
RETURN node.title, score
```

<table>
<thead>
<tr>
<th>node.title</th>
<th>score</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;Full Metal Jacket&quot;</td>
<td>1.41118507385254</td>
</tr>
<tr>
<td>&quot;Full Moon High&quot;</td>
<td>0.4452485521698</td>
</tr>
<tr>
<td>&quot;Yellow Jacket&quot;</td>
<td>0.3509605824947357</td>
</tr>
<tr>
<td>&quot;The Jacket&quot;</td>
<td>0.3509605824947357</td>
</tr>
</tbody>
</table>

Full-text indexes are powered by the Apache Lucene indexing and search library. This means that we can use Lucene's full-text query language to express what we wish to search for. For instance, if we are only interested in exact matches, then we can quote the string we are searching for.

Query

```sql
CALL db.index.fulltext.queryNodes("titlesAndDescriptions", ""Full Metal Jacket"\") YIELD node, score
RETURN node.title, score
```

When we put "Full Metal Jacket" in quotes, Lucene only gives us exact matches.

Table 441. Result

<table>
<thead>
<tr>
<th>node.title</th>
<th>score</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;Full Metal Jacket&quot;</td>
<td>1.41118507385254</td>
</tr>
</tbody>
</table>

Lucene also allows us to use logical operators, such as **AND** and **OR**, to search for terms:
Only the Full Metal Jacket movie in our database has both the words full and metal.

Table 442. Result

<table>
<thead>
<tr>
<th>node.title</th>
<th>score</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;Full Metal Jacket&quot;</td>
<td>1.1113792657852173</td>
</tr>
</tbody>
</table>

Rows: 1

It is also possible to search for only specific properties, by putting the property name and a colon in front of the text being searched for.

A complete description of the Lucene query syntax can be found in the Lucene documentation.

16.4. Drop full-text indexes

A full-text node index is dropped by using the same command as for other indexes, DROP INDEX.

In the following example, we will drop the taggedByRelationshipIndex that we created previously:

Query

```
DROP INDEX taggedByRelationshipIndex
```

Table 444. Result

(empty result)

Rows: 0
Indexes removed: 1
Chapter 17. Constraints

This section explains how to manage constraints used for ensuring data integrity.

17.1. Types of constraint

The following constraint types are available:

**Unique node property constraints**

Unique property constraints ensure that property values are unique for all nodes with a specific label. Unique constraints do not mean that all nodes have to have a unique value for the properties — nodes without the property are not subject to this rule.

**Node property existence constraints**

Node property existence constraints ensure that a property exists for all nodes with a specific label. Queries that try to create new nodes of the specified label, but without this property, will fail. The same is true for queries that try to remove the mandatory property.

**Relationship property existence constraints**

Property existence constraints ensure that a property exists for all relationships with a specific type. All queries that try to create relationships of the specified type, but without this property, will fail. The same is true for queries that try to remove the mandatory property.

**Node key constraints**

Node key constraints ensure that, for a given label and set of properties:

i. All the properties exist on all the nodes with that label.

ii. The combination of the property values is unique.

Queries attempting to do any of the following will fail:

- Create new nodes without all the properties or where the combination of property values is not unique.
- Remove one of the mandatory properties.
- Update the properties so that the combination of property values is no longer unique.

Node key constraints, node property existence constraints and relationship property existence constraints are only available in Neo4j Enterprise Edition. Databases containing one of these constraint types cannot be opened using Neo4j Community Edition.

17.2. Implications on indexes

Creating a constraint has the following implications on indexes:
• Adding a unique property constraint on a property will also add a single-property index on that property, so such an index cannot be added separately.

• Adding a node key constraint for a set of properties will also add a composite index on those properties, so such an index cannot be added separately.

• Cypher will use these indexes for lookups just like other indexes. Refer to Indexes for search performance for more details on indexes.

• If a unique property constraint is dropped and the single-property index on the property is still required, the index will need to be created explicitly.

• If a node key constraint is dropped and the composite-property index on the properties is still required, the index will need to be created explicitly.

Additionally, the following is true for constraints:

• A given label can have multiple constraints, and unique and property existence constraints can be combined on the same property.

• Adding constraints is an atomic operation that can take a while — all existing data has to be scanned before Neo4j can turn the constraint 'on'.

• Best practice is to give the constraint a name when it is created. If the constraint is not explicitly named, it will get an auto-generated name.

• The constraint name must be unique among both indexes and constraints.

• Constraint creation is by default not idempotent, and an error will be thrown if you attempt to create the same constraint twice. Using the keyword IF NOT EXISTS makes the command idempotent, and no error will be thrown if you attempt to create the same constraint twice.

17.3. Syntax

Syntax for how to manage constraints used for ensuring data integrity.

17.3.1. Syntax for creating constraints

Best practice when creating a constraint is to give the constraint a name. This name must be unique among both indexes and constraints. If a name is not explicitly given, a unique name will be auto-generated.

The create constraint command is optionally idempotent, with the default behavior to throw an error if you attempt to create the same constraint twice. With the IF NOT EXISTS flag, no error is thrown and nothing happens should a constraint with the same name or same schema and constraint type already exist. It may still throw an error if conflicting data, indexes, or constraints exist. Examples of this are nodes with missing properties, indexes with the same name, or constraints with same schema but a different constraint type.

For constraints that are backed by an index, the index provider and configuration for the backing index can be specified using the OPTIONS clause.

Creating a constraint requires the CREATE CONSTRAINT privilege.
Create a unique node property constraint

This command creates a uniqueness constraint on nodes with the specified label and property.

```sql
CREATE CONSTRAINT [constraint_name] [IF NOT EXISTS]
ON (n:LabelName)
ASSERT n.propertyName IS UNIQUE
[OPTIONS "{" option: value[, ... ] "}"]
```

Create a node property existence constraint

This command creates a property existence constraint on nodes with the specified label and property.

```sql
CREATE CONSTRAINT [constraint_name] [IF NOT EXISTS]
ON (n:LabelName)
ASSERT n.propertyName IS NOT NULL
```

Create a relationship property existence constraint

This command creates a property existence constraint on relationships with the specified relationship type and property.

```sql
CREATE CONSTRAINT [constraint_name] [IF NOT EXISTS]
ON ()-"[R:RELATIONSHIP_TYPE]"-()
ASSERT R.propertyName IS NOT NULL
```

Create a node key constraint

This command creates a node key constraint on nodes with the specified label and properties.

```sql
CREATE CONSTRAINT [constraint_name] [IF NOT EXISTS]
ON (n:LabelName)
ASSERT (n.propertyName_1,
    n.propertyName_2,
    ...
    n.propertyName_n)
IS NODE KEY
[OPTIONS "{" option: value[, ... ] "}"]
```

17.3.2. Syntax for dropping constraints

Drop a constraint

The preferred way of dropping a constraint is by the name of the constraint.

This drop command is optionally idempotent, with the default behavior to throw an error if you attempt to drop the same constraint twice. With the IF EXISTS flag, no error is thrown and nothing happens should the constraint not exist.

Dropping a constraint requires the DROP CONSTRAINT privilege.
Drop a unique constraint without specifying a name

An old way of dropping a uniqueness constraint was to drop the constraint by specifying the schema of the constraint.

```
DROP CONSTRAINT constraint_name [IF EXISTS]
```

Drop a node property existence constraint without specifying a name

An old way of dropping a node property existence constraint was to drop the constraint by specifying the schema of the constraint.

```
DROP CONSTRAINT
ON (n:LabelName)
ASSERT EXISTS (n.propertyName)
```

Drop a relationship property existence constraint without specifying a name

An old way of dropping a relationship property existence constraint was to drop the constraint by specifying the schema of the constraint.

```
DROP CONSTRAINT
ON ()-[*:"R:RELATIONSHIP_TYPE"]-*()
ASSERT EXISTS (R.propertyName)
```

Drop a node key constraint without specifying a name

An old way of dropping a node key constraint was to drop the constraint by specifying the schema of the constraint.

```
DROP CONSTRAINT
ON (n:LabelName)
ASSERT n.propertyName IS UNIQUE
```

17.3.3. Syntax for listing constraints

List constraints in the database, either all or filtered on constraint type. This requires the `SHOW CONSTRAINT` privilege.

The simple version of the command allows for a `WHERE` clause and will give back the default set of output columns:
To get the full set of output columns, a yield clause is needed:

```
SHOW [ALL | UNIQUE | NODE [PROPERTY] EXISTENCE] [RELATIONSHIP [PROPERTY] EXISTENCE] [PROPERTY] EXISTENCE [NODE KEY] CONSTRAINT[S] [WHERE expression]
```

```
SHOW [ALL | UNIQUE | NODE [PROPERTY] EXISTENCE] [RELATIONSHIP [PROPERTY] EXISTENCE] [PROPERTY] EXISTENCE [NODE KEY] CONSTRAINT[S]
  YIELD { * | field[, ...] } [ORDER BY field[, ...]] [SKIP n] [LIMIT n]
  [WHERE expression]
  [RETURN field[, ...] [ORDER BY field[, ...]] [SKIP n] [LIMIT n]]
```

The returned columns from the show command is:

**Table 445. List constraints output**

<td>✔</td>
<td></td>
</tr>
</tbody>
</table>

The deprecated built-in procedures for listing constraints, such as `db.constraints`, work as before and are not affected by the `SHOW CONSTRAINTS` privilege.
17.4. Examples

Examples of how to manage constraints used for ensuring data integrity.

17.4.1. Unique node property constraints

Create a unique constraint

When creating a unique constraint, a name can be provided. The constraint ensures that your database will never contain more than one node with a specific label and one property value.

Query

```sql
CREATE CONSTRAINT constraint_name ON (book:Book) ASSERT book.isbn IS UNIQUE
```

Result

```
+-------------------+
| No data returned. |
| Unique constraints added: 1 |
```

Create a unique constraint only if it does not already exist

If it is unknown if a constraint exists or not but we want to make sure it does, we add the `IF NOT EXISTS`. The uniqueness constraint ensures that your database will never contain more than one node with a specific label and one property value.

Query

```sql
CREATE CONSTRAINT constraint_name IF NOT EXISTS ON (book:Book) ASSERT book.isbn IS UNIQUE
```

Note no constraint will be created if any other constraint with that name or another uniqueness constraint on the same schema already exists. Assuming no such constraints existed:

Result

```
+-------------------+
| No data returned. |
| Unique constraints added: 1 |
```

Create a unique constraint with specified index provider and configuration

To create a unique constraint with a specific index provider and configuration for the backing index, the `OPTIONS` clause is used. Valid values for the index provider is `native-btree-1.0` and `lucene+native-3.0`, default if nothing is specified is `native-btree-1.0`. Valid configuration settings are `spatial.cartesian.min`,

388
spatial.cartesian.max, spatial.cartesian-3d.min, spatial.cartesian-3d.max, spatial.wgs-84.min, spatial.wgs-84.max, spatial.wgs-84-3d.min, and spatial.wgs-84-3d.max. Non-specified settings get their respective default values.

Query

```sql
CREATE CONSTRAINT constraint_with_options ON (n:Label) ASSERT n.prop IS UNIQUE
OPTIONS {
  indexProvider: 'lucene+native-3.0',
  indexConfig: {
    'spatial.wgs-84.min': [-100.0, -80.0],
    'spatial.wgs-84.max': [100.0, 80.0]
  }
}
```

Specifying index provider and configuration can be done individually.

Result

```
+-------------------+
| No data returned. |
+-------------------+
Unique constraints added: 1
```

Create a node that complies with unique property constraints

Create a Book node with an isbn that isn’t already in the database.

Query

```sql
CREATE (book:Book {isbn: '1449356265', title: 'Graph Databases'})
```

Result

```
+-------------------+
<table>
<thead>
<tr>
<th>No data returned.</th>
</tr>
</thead>
</table>
+-------------------+
Nodes created: 1
Properties set: 2
Labels added: 1
```

Create a node that violates a unique property constraint

Create a Book node with an isbn that is already used in the database.

Query

```sql
CREATE (book:Book {isbn: '1449356265', title: 'Graph Databases'})
```

In this case the node isn’t created in the graph.

Error message

```
Node(0) already exists with label 'Book' and property 'isbn' = '1449356265'
```

Failure to create a unique property constraint due to conflicting
Create a unique property constraint on the property `isbn` on nodes with the `Book` label when there are two nodes with the same `isbn`.

Query

```
CREATE CONSTRAINT ON (book:Book) ASSERT book.isbn IS UNIQUE
```

In this case the constraint can’t be created because it is violated by existing data. We may choose to use indexes for search performance instead or remove the offending nodes and then re-apply the constraint.

Error message

```
Unable to create Constraint( name='constraint_ca412c3d', type='UNIQUENESS',
schema=(:Book {isbn}) ):
Both Node(0) and Node(1) have the label 'Book' and property 'isbn' = '1449356265'
```
Chapter 18. Node property existence constraints

Create a node property existence constraint

When creating a node property existence constraint, a name can be provided. The constraint ensures that all nodes with a certain label have a certain property.

Query

```
CREATE CONSTRAINT constraint_name ON (book:Book) ASSERT book.isbn IS NOT NULL
```

Result

```
+-------------------+
| No data returned. |
| Property existence constraints added: 1 |
+-------------------+
```

Create a node property existence constraint only if it does not already exist

If it is unknown if a constraint exists or not but we want to make sure it does, we add the `IF NOT EXISTS`. The node property existence constraint ensures that all nodes with a certain label have a certain property.

Query

```
CREATE CONSTRAINT constraint_name IF NOT EXISTS ON (book:Book) ASSERT book.isbn IS NOT NULL
```

Note no constraint will be created if any other constraint with that name or another node property existence constraint on the same schema already exists. Assuming a constraint with the name `constraint_name` already existed:

Result

```
+---------------------------------------------------------------------+
| No data returned, and nothing was changed.                           |
+---------------------------------------------------------------------+
```

Create a node that complies with property existence constraints

Create a `Book` node with an `isbn` property.

Query

```
CREATE (book:Book {isbn: '1449356265', title: 'Graph Databases'})
```
Create a node that violates a property existence constraint

Trying to create a Book node without an isbn property, given a property existence constraint on :Book(isbn).

Query

```
CREATE (book:Book {title: 'Graph Databases'})
```

In this case the node isn’t created in the graph.

Error message

“Node(0) with label `Book` must have the property `isbn`”

Removing an existence constrained node property

Trying to remove the isbn property from an existing node book, given a property existence constraint on :Book(isbn).

Query

```
MATCH (book:Book {title: 'Graph Databases'}) REMOVE book.isbn
```

In this case the property is not removed.

Error message

“Node(0) with label `Book` must have the property `isbn`”

Failure to create a node property existence constraint due to existing node

Create a constraint on the property isbn on nodes with the Book label when there already exists a node without an isbn.

Query

```
CREATE CONSTRAINT ON (book:Book) ASSERT book.isbn IS NOT NULL
```

In this case the constraint can’t be created because it is violated by existing data. We may choose to
remove the offending nodes and then re-apply the constraint.

Error message

Unable to create Constraint( type='NODE PROPERTY EXISTENCE', schema=(:Book {isbn}) ):
Node(0) with label 'Book' must have the property 'isbn'
Create a relationship property existence constraint

When creating a relationship property existence constraint, a name can be provided. The constraint ensures all relationships with a certain type have a certain property.

Query

```
CREATE CONSTRAINT constraint_name ON ()-[like:LIKED]-() ASSERT like.day IS NOT NULL
```

Result

```
+-------------------+
| No data returned. |
+-------------------+
Property existence constraints added: 1
```

Create a relationship property existence constraint only if it does not already exist

If it is unknown if a constraint exists or not but we want to make sure it does, we add the `IF NOT EXISTS`.

The relationship property existence constraint ensures all relationships with a certain type have a certain property.

Query

```
CREATE CONSTRAINT constraint_name IF NOT EXISTS ON ()-[like:LIKED]-() ASSERT like.day IS NOT NULL
```

Result

```
+--------------------------------------------+
| No data returned, and nothing was changed. |
+--------------------------------------------+
```

Create a relationship that complies with property existence constraints

Create a `LIKED` relationship with a `day` property.
Query

```
CREATE (user:User)-[:LIKE: {day: 'yesterday'}]->(book:Book)
```

Result

```
+-------------------+
| No data returned. |
+-------------------+
Nodes created: 2
Relationships created: 1
Properties set: 1
Labels added: 2
```

Create a relationship that violates a property existence constraint

Trying to create a LIKED relationship without a `day` property, given a property existence constraint :LIKED(day).

Query

```
CREATE (user:User)-[:LIKE]->(book:Book)
```

In this case the relationship isn't created in the graph.

Error message

```
Relationship(0) with type 'LIKED' must have the property 'day'
```

Removing an existence constrained relationship property

Trying to remove the `day` property from an existing relationship like of type LIKED, given a property existence constraint :LIKED(day).

Query

```
MATCH (user:User)-[like:LIKE]->(book:Book) REMOVE like.day
```

In this case the property is not removed.

Error message

```
Relationship(0) with type 'LIKED' must have the property 'day'
```

Failure to create a relationship property existence constraint due to existing relationship

Create a constraint on the property `day` on relationships with the LIKED type when there already exists a relationship without a property named `day`. 
Query

```
CREATE CONSTRAINT ON ()-[like:LIKED]-() ASSERT like.day IS NOT NULL
```

In this case the constraint can't be created because it is violated by existing data. We may choose to remove the offending relationships and then re-apply the constraint.

Error message

```
Unable to create Constraint( type='RELATIONSHIP PROPERTY EXISTENCE',
    schema=-[:LIKED {day}]-):
Relationship(0) with type `LIKED` must have the property `day`
```
Chapter 20. Node key constraints

Create a node key constraint

When creating a node key constraint, a name can be provided. The constraint ensures that all nodes with a particular label have a set of defined properties whose combined value is unique and all properties in the set are present.

Query

```
CREATE CONSTRAINT constraint_name ON (n:Person) ASSERT (n.firstname, n.surname) IS NODE KEY
```

Result

<table>
<thead>
<tr>
<th>No data returned.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Node key constraints added: 1</td>
</tr>
</tbody>
</table>

Create a node key constraint only if it does not already exist

If it is unknown if a constraint exists or not but we want to make sure it does, we add the `IF NOT EXISTS`. The node key constraint ensures that all nodes with a particular label have a set of defined properties whose combined value is unique and all properties in the set are present.

Query

```
CREATE CONSTRAINT constraint_name IF NOT EXISTS ON (n:Person) ASSERT (n.firstname, n.surname) IS NODE KEY
```

Note no constraint will be created if any other constraint with that name or another node key constraint on the same schema already exists. Assuming a node key constraint on `(:Person {firstname, surname})` already existed:

Result

| No data returned, and nothing was changed. |

Create a node key constraint with specified index provider

To create a node key constraint with a specific index provider for the backing index, the `OPTIONS` clause is used. Valid values for the index provider is `native-btree-1.0` and `lucene+native-3.0`, default if nothing is specified is `native-btree-1.0`. 
CREATE CONSTRAINT constraint_with_provider ON (n:Label) ASSERT (n.prop1) IS NODE KEY OPTIONS {indexProvider: 'native-btree-1.0'}

Can be combined with specifying index configuration.

Result

+-------------------+
| No data returned. |
+-------------------+
Node key constraints added: 1

Create a node key constraint with specified index configuration

To create a node key constraint with a specific index configuration for the backing index, the OPTIONS clause is used. Valid configuration settings are `spatial.cartesian.min`, `spatial.cartesian.max`, `spatial.cartesian-3d.min`, `spatial.cartesian-3d.max`, `spatial.wgs-84.min`, `spatial.wgs-84.max`, `spatial.wgs-84-3d.min`, and `spatial.wgs-84-3d.max`. Non-specified settings get their respective default values.

CREATE CONSTRAINT constraint_with_config ON (n:Label) ASSERT (n.prop2) IS NODE KEY OPTIONS {indexConfig: {`spatial.cartesian.min`: [-100.0, -100.0], `spatial.cartesian.max`: [100.0, 100.0]}}

Can be combined with specifying index provider.

Result

+-------------------+
| No data returned. |
+-------------------+
Node key constraints added: 1

Create a node that complies with node key constraints

Create a Person node with both a firstname and surname property.

CREATE (p:Person {firstname: 'John', surname: 'Wood', age: 55})

Result

+-------------------+
| No data returned. |
+-------------------+
Nodes created: 1
Properties set: 3
Labels added: 1
Create a node that violates a node key constraint

Trying to create a `Person` node without a `surname` property, given a node key constraint on `:Person(firstname, surname)`, will fail.

Query

```sql
CREATE (p:Person {firstname: 'Jane', age: 34})
```

In this case the node isn't created in the graph.

Error message

```
Node(0) with label `Person` must have the properties (firstname, surname)
```

Removing a **NODE KEY**-constrained property

Trying to remove the `surname` property from an existing node `Person`, given a **NODE KEY** constraint on `:Person(firstname, surname)`.

Query

```sql
MATCH (p:Person {firstname: 'John', surname: 'Wood'}) REMOVE p.surname
```

In this case the property is not removed.

Error message

```
Node(0) with label `Person` must have the properties (firstname, surname)
```

Failure to create a node key constraint due to existing node

Trying to create a node key constraint on the property `surname` on nodes with the `Person` label will fail when a node without a `surname` already exists in the database.

Query

```sql
CREATE CONSTRAINT ON (n:Person) ASSERT (n.firstname, n.surname) IS NODE KEY
```

In this case the node key constraint can't be created because it is violated by existing data. We may choose to remove the offending nodes and then re-apply the constraint.

Error message

```
Unable to create Constraint( name='constraint_c57fc9b0', type='NODE KEY', schema=(:Person {firstname, surname})):
Failed during property existence validation: Unable to create constraint
org.neo4j.internal.schema.constraints.ConstraintDescriptorImplementation@f64c40:
Node(0) does not satisfy Constraint( type='NODE PROPERTY EXISTENCE',
schema=(:Person {firstname, surname})).
```
Chapter 21. Drop a constraint by name

Drop a constraint

A constraint can be dropped using the name with the DROP CONSTRAINT constraint_name command. It is the same command for unique property, property existence and node key constraints. The name of the constraint can be found using the SHOW CONSTRAINTS command, given in the output column name.

Query

```
DROP CONSTRAINT constraint_name
```

Result

```
+-------------------+
| No data returned. |
+-------------------+

Named constraints removed: 1
```

Drop a non-existing constraint

If it is uncertain if any constraint with a given name exists and you want to drop it if it does but not get an error should it not, use IF EXISTS. It is the same command for unique property, property existence and node key constraints.

Query

```
DROP CONSTRAINT missing_constraint_name IF EXISTS
```

Result

```
+--------------------------------------------+
| No data returned, and nothing was changed. |
+--------------------------------------------+
```
Chapter 22. Listing constraints

Listing all constraints

To list all constraints with the default output columns, the `SHOW CONSTRAINTS` command can be used. If all columns are required, use `SHOW CONSTRAINTS YIELD *`.

Query

```
SHOW CONSTRAINTS
```

One of the output columns from `SHOW CONSTRAINTS` is the name of the constraint. This can be used to drop the constraint with the `DROP CONSTRAINT` command.

Result

```
+----------------------------------------------------------------------------------------------------+
| id | name                  | type         | entityType | labelsOrTypes | properties | ownedIndexId |
+----------------------------------------------------------------------------------------------------+
| 4  | "constraint_ca412c3d" | "UNIQUENESS" | "NODE"     | ["Book"]      | ["isbn"]   | 3            |
+----------------------------------------------------------------------------------------------------+
1 row
```

Listing constraints with filtering

One way of filtering the output from `SHOW CONSTRAINTS` by constraint type is the use of type keywords, listed in Syntax for listing constraints. For example, to show only unique node property constraints, use `SHOW UNIQUE CONSTRAINTS`. Another more flexible way of filtering the output is to use the `WHERE` clause. An example is to only show constraints on relationships.

Query

```
SHOW EXISTENCE CONSTRAINTS WHERE entityType = 'RELATIONSHIP'
```

This will only return the default output columns. To get all columns, use `SHOW INDEXES YIELD * WHERE ...`

Result

```
+---------------------------------------------------------------------------------------------------------+--------------------+
| id | name                  | type                              | entityType     | labelsOrTypes |
| 7  | "constraint_f076a74d" | "RELATIONSHIP_PROPERTY_EXISTENCE" | "RELATIONSHIP" | ["KNOWS"]    |
|     |                       |                                   |               | ["since"]    |
|     |                       |                                   | <null>         |               |
+---------------------------------------------------------------------------------------------------------+--------------------+
1 row
```
Chapter 23. Deprecated syntax

Drop a unique constraint

By using DROP CONSTRAINT, you remove a constraint from the database.

Query

```sql
DROP CONSTRAINT ON (book:Book) ASSERT book.isbn IS UNIQUE
```

Result

```
+-------------------+
| No data returned. |
| Unique constraints removed: 1 |
+-------------------+
```

Drop a node property existence constraint

By using DROP CONSTRAINT, you remove a constraint from the database.

Query

```sql
DROP CONSTRAINT ON (book:Book) ASSERT exists(book.isbn)
```

Result

```
+-------------------+
| No data returned. |
| Property existence constraints removed: 1 |
+-------------------+
```

Drop a relationship property existence constraint

To remove a constraint from the database, use DROP CONSTRAINT.

Query

```sql
DROP CONSTRAINT ON ()-[like:LIKED]-() ASSERT exists(like.day)
```

Result

```
+-------------------+
| No data returned. |
| Property existence constraints removed: 1 |
+-------------------+
```

Drop a node key constraint

Use DROP CONSTRAINT to remove a node key constraint from the database.
Query

```
DROP CONSTRAINT ON (n:Person) ASSERT (n.firstname, n.surname) IS NODE KEY
```

Result

```
+-------------------+
| No data returned. |
+-------------------+
Node key constraints removed: 1
```
Chapter 24. Database management

This chapter explains how to use Cypher to manage Neo4j databases: creating, deleting, starting and stopping individual databases within a single server.

Neo4j supports the management of multiple databases within the same DBMS. The metadata for these databases, including the associated security model, is maintained in a special database called the `system` database. All multi-database administrative commands must be run against the `system` database. These administrative commands are automatically routed to the `system` database when connected to the DBMS over Bolt.

The syntax of the database management commands is as follows:

<table>
<thead>
<tr>
<th>Command</th>
<th>Syntax</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Show Database</strong></td>
<td>SHOW ( DATABASE name</td>
</tr>
<tr>
<td></td>
<td>SHOW ( DATABASE name</td>
</tr>
<tr>
<td><strong>Create Database</strong></td>
<td>CREATE DATABASE name [IF NOT EXISTS] [OPTIONS &quot;{&quot; option: value[, ...] &quot;}] [WAIT [n [SEC[OND[S]]]]</td>
</tr>
<tr>
<td></td>
<td>CREATE OR REPLACE DATABASE name [WAIT [n [SEC[OND[S]]]]</td>
</tr>
<tr>
<td><strong>Stop Database</strong></td>
<td>STOP DATABASE name [WAIT [n [SEC[OND[S]]]]</td>
</tr>
<tr>
<td><strong>Start Database</strong></td>
<td>START DATABASE name [WAIT [n [SEC[OND[S]]]]</td>
</tr>
<tr>
<td><strong>Drop Database</strong></td>
<td>DROP DATABASE name [IF EXISTS] ([DUMP</td>
</tr>
</tbody>
</table>

24.1. Listing databases

There are three different commands for listing databases. Listing all databases, listing a particular database or listing the default database.
All available databases can be seen using the command `SHOW DATABASES`.

**Query**
```
SHOW DATABASES
```

**Table 447. Result**

<table>
<thead>
<tr>
<th>name</th>
<th>address</th>
<th>role</th>
<th>requestedStatus</th>
<th>currentStatus</th>
<th>error</th>
<th>default</th>
<th>home</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;movies&quot;</td>
<td>&quot;localhost:7687&quot;</td>
<td>&quot;standalone&quot;</td>
<td>&quot;online&quot;</td>
<td>&quot;online&quot;</td>
<td>&quot;&quot;</td>
<td>false</td>
<td>false</td>
</tr>
<tr>
<td>&quot;neo4j&quot;</td>
<td>&quot;localhost:7687&quot;</td>
<td>&quot;standalone&quot;</td>
<td>&quot;online&quot;</td>
<td>&quot;online&quot;</td>
<td>&quot;&quot;</td>
<td>true</td>
<td>true</td>
</tr>
<tr>
<td>&quot;northwind-graph&quot;</td>
<td>&quot;localhost:7687&quot;</td>
<td>&quot;standalone&quot;</td>
<td>&quot;online&quot;</td>
<td>&quot;online&quot;</td>
<td>&quot;&quot;</td>
<td>false</td>
<td>false</td>
</tr>
<tr>
<td>&quot;system&quot;</td>
<td>&quot;localhost:7687&quot;</td>
<td>&quot;standalone&quot;</td>
<td>&quot;online&quot;</td>
<td>&quot;online&quot;</td>
<td>&quot;&quot;</td>
<td>false</td>
<td>false</td>
</tr>
</tbody>
</table>

Rows: 4

Note that the results of this command are filtered according to the ACCESS privileges the user has. However, a user with CREATE/DROP DATABASE or DATABASE MANAGEMENT privileges can see all databases regardless of their ACCESS privileges. If a user has not been granted ACCESS privilege to any databases, the command can still be executed but will only return the system database, which is always visible.

The number of databases can be seen using a `count()` aggregation with `YIELD` and `RETURN`.

**Query**
```
SHOW DATABASES YIELD * RETURN count(*) as count
```

**Table 448. Result**

<table>
<thead>
<tr>
<th>count</th>
</tr>
</thead>
<tbody>
<tr>
<td>4</td>
</tr>
</tbody>
</table>

Rows: 1

A particular database can be seen using the command `SHOW DATABASE name`.

**Query**
```
SHOW DATABASE system
```

**Table 449. Result**

<table>
<thead>
<tr>
<th>name</th>
<th>address</th>
<th>role</th>
<th>requestedStatus</th>
<th>currentStatus</th>
<th>error</th>
<th>default</th>
<th>home</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;system&quot;</td>
<td>&quot;localhost:7687&quot;</td>
<td>&quot;standalone&quot;</td>
<td>&quot;online&quot;</td>
<td>&quot;online&quot;</td>
<td>&quot;&quot;</td>
<td>false</td>
<td>false</td>
</tr>
</tbody>
</table>
The default database can be seen using the command `SHOW DEFAULT DATABASE`.

Query

```
SHOW DEFAULT DATABASE
```

Table 450. Result

<table>
<thead>
<tr>
<th>name</th>
<th>address</th>
<th>role</th>
<th>requestedStatus</th>
<th>currentStatus</th>
<th>error</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;neo4j&quot;</td>
<td>&quot;localhost:7687&quot;</td>
<td>&quot;standalone&quot;</td>
<td>&quot;online&quot;</td>
<td>&quot;online&quot;</td>
<td>&quot;&quot;</td>
</tr>
</tbody>
</table>

Rows: 1

The home database for the current user can be seen using the command `SHOW HOME DATABASE`.

Query

```
SHOW HOME DATABASE
```

Table 451. Result

<table>
<thead>
<tr>
<th>name</th>
<th>address</th>
<th>role</th>
<th>requestedStatus</th>
<th>currentStatus</th>
<th>error</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;neo4j&quot;</td>
<td>&quot;localhost:7687&quot;</td>
<td>&quot;standalone&quot;</td>
<td>&quot;online&quot;</td>
<td>&quot;online&quot;</td>
<td>&quot;&quot;</td>
</tr>
</tbody>
</table>

Rows: 1

It is also possible to filter and sort the results by using `YIELD`, `ORDER BY` and `WHERE`.

Query

```
SHOW DATABASES YIELD name, currentStatus, requestedStatus ORDER BY currentStatus WHERE name CONTAINS 'e'
```

In this example:

- The number of columns returned has been reduced with the `YIELD` clause.
- The order of the returned columns has been changed.
- The results have been filtered to only show database names containing 'e'.
- The results are ordered by the 'currentStatus' column using `ORDER BY`.

It is also possible to use `SKIP` and `LIMIT` to paginate the results.

Table 452. Result

<table>
<thead>
<tr>
<th>name</th>
<th>currentStatus</th>
<th>requestedStatus</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;neo4j&quot;</td>
<td>&quot;online&quot;</td>
<td>&quot;online&quot;</td>
</tr>
<tr>
<td>&quot;system&quot;</td>
<td>&quot;online&quot;</td>
<td>&quot;online&quot;</td>
</tr>
<tr>
<td>name</td>
<td>currentStatus</td>
<td>requestedStatus</td>
</tr>
<tr>
<td>---------</td>
<td>---------------</td>
<td>-----------------</td>
</tr>
<tr>
<td>&quot;movies&quot;</td>
<td>&quot;online&quot;</td>
<td>&quot;online&quot;</td>
</tr>
</tbody>
</table>

Note that for failed databases, the currentStatus and requestedStatus are different. This often implies an error, but does not always. For example, a database may take a while to transition from offline to online due to performing recovery. Or, during normal operation a database's currentStatus may be transiently different from its requestedStatus due to a necessary automatic process, such as one Neo4j instance copying store files from another. The possible statuses are initial, online, offline, store copying and unknown.

24.2. Creating databases

Databases can be created using CREATE DATABASE.

Query

```
CREATE DATABASE customers
```

0 rows, System updates: 1

Database names are subject to the standard Cypher restrictions on valid identifiers. The following naming rules apply:

- Database name length must be between 3 and 63 characters.
- The first character must be an ASCII alphabetic character.
- Subsequent characters can be ASCII alphabetic (mydatabase), numeric characters (mydatabase2), dots (main.db), and dashes (enclosed within backticks, e.g., CREATE DATABASE `main-db`).
- Names cannot end with dots or dashes.
- Names that begin with an underscore or with the prefix system are reserved for internal use.

When a database has been created, it will show up in the listing provided by the command SHOW DATABASES.

Query

```
SHOW DATABASES
```

Table 453. Result
24.2.1. Handling Existing Databases **Enterprise edition**

This command is optionally idempotent, with the default behavior to throw an exception if the database already exists. Appending `IF NOT EXISTS` to the command will ensure that no exception is thrown and nothing happens should the database already exist. Adding `OR REPLACE` to the command will result in any existing database being deleted and a new one created.

Query

```
CREATE DATABASE customers IF NOT EXISTS
```

Query

```
CREATE OR REPLACE DATABASE customers
```

This is equivalent to running `DROP DATABASE customers IF EXISTS` followed by `CREATE DATABASE customers`.

ℹ The `IF NOT EXISTS` and `OR REPLACE` parts of this command cannot be used together.

24.2.2. Options **Enterprise edition**

The create database command can have a map of options, e.g. `OPTIONS { key : 'value'}`

<table>
<thead>
<tr>
<th>Key</th>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>existingData</td>
<td>use</td>
<td>Controls how the system handles existing data on disk when creating the</td>
</tr>
<tr>
<td></td>
<td></td>
<td>database. Currently this is only supported with <code>existingDataSeedInstance</code></td>
</tr>
<tr>
<td></td>
<td></td>
<td>and must be set to <code>use</code> which indicates the existing data files should be</td>
</tr>
<tr>
<td></td>
<td></td>
<td>used for the new database.</td>
</tr>
<tr>
<td>Key</td>
<td>Value</td>
<td>Description</td>
</tr>
<tr>
<td>------------------------</td>
<td>----------------------------</td>
<td>--------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>existingDataSeedInstance</td>
<td>instance ID of the cluster node</td>
<td>Defines which instance is used for seeding the data of the created database. The instance id can be taken from the id column of the dbms.cluster.overview() procedure. Can only be used in clusters.</td>
</tr>
</tbody>
</table>

The existingData and existingDataSeedInstance options cannot be combined with the OR REPLACE part of this command.

24.3. Stopping databases **Enterprise edition**

Databases can be stopped using the command `STOP DATABASE`.

Query

```
STOP DATABASE customers
```

0 rows, System updates: 1

The status of the stopped database can be seen using the command `SHOW DATABASE name`.

Query

```
SHOW DATABASE customers
```

**Table 454. Result**

<table>
<thead>
<tr>
<th>name</th>
<th>address</th>
<th>role</th>
<th>requestedStatus</th>
<th>currentStatus</th>
<th>error</th>
<th>default</th>
<th>home</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;customers&quot;</td>
<td>&quot;localhost:7687&quot;</td>
<td>&quot;standalone&quot;</td>
<td>&quot;offline&quot;</td>
<td>&quot;offline&quot;</td>
<td>&quot;&quot;</td>
<td>false</td>
<td>false</td>
</tr>
</tbody>
</table>

Rows: 1

24.4. Starting databases **Enterprise edition**

Databases can be started using the command `START DATABASE`.

Query

```
START DATABASE customers
```

0 rows, System updates: 1

The status of the started database can be seen using the command `SHOW DATABASE name`. 
24.5. Deleting databases

Databases can be deleted using the command DROP DATABASE.

Query

```
DROP DATABASE customers
```

0 rows, System updates: 1

When a database has been deleted, it will no longer show up in the listing provided by the command SHOW DATABASES.

Query

```
SHOW DATABASES
```

Table 456. Result

<table>
<thead>
<tr>
<th>name</th>
<th>address</th>
<th>role</th>
<th>requestedStatus</th>
<th>currentStatus</th>
<th>error</th>
<th>default</th>
<th>home</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;movies&quot;</td>
<td>&quot;localhost:7687&quot;</td>
<td>&quot;standalone&quot;</td>
<td>&quot;online&quot;</td>
<td>&quot;online&quot;</td>
<td>&quot;&quot;</td>
<td>false</td>
<td>false</td>
</tr>
<tr>
<td>&quot;neo4j&quot;</td>
<td>&quot;localhost:7687&quot;</td>
<td>&quot;standalone&quot;</td>
<td>&quot;online&quot;</td>
<td>&quot;online&quot;</td>
<td>&quot;&quot;</td>
<td>true</td>
<td>true</td>
</tr>
<tr>
<td>&quot;northwind-graph&quot;</td>
<td>&quot;localhost:7687&quot;</td>
<td>&quot;standalone&quot;</td>
<td>&quot;online&quot;</td>
<td>&quot;online&quot;</td>
<td>&quot;&quot;</td>
<td>false</td>
<td>false</td>
</tr>
<tr>
<td>&quot;system&quot;</td>
<td>&quot;localhost:7687&quot;</td>
<td>&quot;standalone&quot;</td>
<td>&quot;online&quot;</td>
<td>&quot;online&quot;</td>
<td>&quot;&quot;</td>
<td>false</td>
<td>false</td>
</tr>
</tbody>
</table>

Rows: 4

This command is optionally idempotent, with the default behavior to throw an exception if the database does not exist. Appending IF EXISTS to the command will ensure that no exception is thrown and nothing happens should the database not exist.

Query

```
DROP DATABASE customers IF EXISTS
```
The **DROP DATABASE** command will remove a database entirely. However, you can request that a dump of the store files is produced first, and stored in the path configured using the `dbms.directories.dumps.root` setting (by default `<neo4j-home>/data/dumps`). This can be achieved by appending **DUMP DATA** to the command (or **DESTROY DATA** to explicitly request the default behavior). These dumps are equivalent to those produced by `neo4j-admin dump` and can be similarly restored using `neo4j-admin load`.

Query

```
DROP DATABASE customers DUMP DATA
```

The options **IF EXISTS** and **DUMP DATA**/ **DESTROY DATA** can also be combined. An example could look like this:

Query

```
DROP DATABASE customers IF EXISTS DUMP DATA
```

### 24.6. Wait options  

#### Enterprise edition

Aside from **SHOW DATABASES**, all database management commands accept an optional **WAIT/NOWAIT** clause. The **WAIT/NOWAIT** clause allows you to specify a time limit in which the command must complete and return. The options are:

- **WAIT n SECONDS** - Return once completed or when the specified time limit of n seconds is up.
- **WAIT** - Return once completed or when the default time limit of 300 seconds is up.
- **NOWAIT** - Return immediately.

A command using a **WAIT** clause will automatically commit the current transaction when it executes successfully, as the command needs to run immediately for it to be possible to **WAIT** for it to complete. Any subsequent commands executed will therefore be performed in a new transaction. This is different to the usual transactional behavior, and for this reason it is recommended that these commands be run in their own transaction. The default behavior is **NOWAIT**, so if no clause is specified the transaction will behave normally and the action is performed in the background post-commit.

Query

```
CREATE DATABASE slow WAIT 5 SECONDS
```

#### Table 457. Result

<table>
<thead>
<tr>
<th>address</th>
<th>state</th>
<th>message</th>
<th>success</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;localhost:7687&quot;</td>
<td>&quot;CaughtUp&quot;</td>
<td>&quot;caught up&quot;</td>
<td>true</td>
</tr>
</tbody>
</table>

Rows: 1

The **success** column provides an aggregate status of whether or not the command is considered successful and thus every row will have the same value. The intention of this column is to make it easy to determine, for example in a script, whether or not the command completed successfully without timing out.
A command with a `WAIT` clause may be interrupted whilst it is waiting to complete. In this event the command will continue to execute in the background and will not be aborted.
Chapter 25. Access control

This chapter explains how to manage Neo4j role-based access control and fine-grained security.

Neo4j has a complex security model stored in the system graph, maintained in a special database called the system database. All administrative commands need to be executing against the system database. When connected to the DBMS over bolt, administrative commands are automatically routed to the system database. For more information on how to manage multiple databases, refer to the section on administering databases.

Neo4j 3.1 introduced the concept of role-based access control. It was possible to create users and assign them to roles to control whether the users could read, write and administer the database. In Neo4j 4.0 this model was enhanced significantly with the addition of privileges, which are the underlying access-control rules by which the users rights are defined.

The original built-in roles still exist with almost the exact same access rights, but they are no-longer statically defined (see Built-in roles). Instead they are defined in terms of their underlying privileges and they can be modified by adding an removing these access rights.

In addition, any new roles created can by assigned any combination of privileges to create the specific access control desired. A major additional capability is sub-graph access control whereby read-access to the graph can be limited to specific combinations of label, relationship-type and property.

25.1. Syntax summaries

Almost all administration commands have variations in the commands. Parts of the command that are optional or can have multiple values are most common. To show all versions of a command, a summary of the syntax will be presented. These summaries will use some special characters to indicate such variations.

The special characters and their meaning are as follows:

<table>
<thead>
<tr>
<th>Character</th>
<th>Meaning</th>
<th>Example</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Or, used to indicate alternative parts of a command. Needs to be part of a grouping.</td>
<td>If the syntax needs to specify either a name or *, this can be indicated with *</td>
</tr>
<tr>
<td>{ and }</td>
<td>Used to group parts of the command, common together with</td>
<td>.</td>
</tr>
<tr>
<td>[ and ]</td>
<td>Used to indicate an optional part of the command. It also groups alternatives together, when there can be either of the alternatives or nothing.</td>
<td>If a keyword in the syntax can either be in singular or plural, we can indicate that the S is optional with GRAPH[S].</td>
</tr>
<tr>
<td>Character</td>
<td>Meaning</td>
<td>Example</td>
</tr>
<tr>
<td>-----------</td>
<td>---------</td>
<td>---------</td>
</tr>
<tr>
<td>...</td>
<td>Repeated pattern, the command part immediately before this is repeated.</td>
<td>A comma separated list of names would be name[, ...].</td>
</tr>
<tr>
<td>&quot;</td>
<td>When a special character is part of the syntax itself, we surround it with &quot; to indicate this.</td>
<td>To include { in the syntax use &quot;(&quot; { *</td>
</tr>
</tbody>
</table>

The special characters in the table above are the only ones that need to be escaped using " in the syntax summaries.

An example that uses all special characters is granting the READ privilege:

```
GRANT READ
  "{ { * | property[, ...] } "})"
ON (HOME GRAPH | GRAPH[S] { * | name[, ...] }) [ ELEMENT[S] { * | label-or-rel-type[, ...] } | NODE[S] { * | label[, ...] } | RELATIONSHIP[S] { * | rel-type[, ...] } ]
  TO role[, ...]
```

Some things to notice about this command is that it includes { and } in the syntax, and between them has a grouping of either a list of properties or the character *. It also has multiple optional parts, including the entity part of the command which is the grouping following the graph name.

In difference, there is no need to escape any characters in the node property existence constraint creation command. This is because ( and ) are not special characters, and the [ and ] indicate that the constraint name is optional, and are not part of the command.

```
CREATE CONSTRAINT [constraint_name] [IF NOT EXISTS]
ON (n:LabelName)
  ASSERT n.propertyName IS NOT NULL
```

25.2. Managing users

This section explains how to use Cypher to manage users in Neo4j.

Users can be created and managed using a set of Cypher administration commands executed against the system database. When connected to the DBMS over bolt, administration commands are automatically routed to the system database.

25.2.1. User management command syntax

| Command | SHOW CURRENT USER |
### Syntax

```
SHOW CURRENT USER
[YIELD { * | field[, ...] } [ORDER BY field[, ...]] [SKIP n] [LIMIT n]]
[WHERE expression]
[RETURN field[, ...] [ORDER BY field[, ...]] [SKIP n] [LIMIT n]]
```

### Description

Lists the current user.

When using the `RETURN` clause, the `YIELD` clause is mandatory and may not be omitted.

For more information, see [Listing current user](#).

### Required privilege

None

### Command

**SHOW USERS**

### Syntax

```
SHOW USERS
[YIELD { * | field[, ...] } [ORDER BY field[, ...]] [SKIP n] [LIMIT n]]
[WHERE expression]
[RETURN field[, ...] [ORDER BY field[, ...]] [SKIP n] [LIMIT n]]
```

### Description

List all users.

When using the `RETURN` clause, the `YIELD` clause is mandatory and may not be omitted.

For more information, see [Listing users](#).

### Required privilege

**GRANT SHOW USER**

(see [DBMS USER MANAGEMENT privileges](#))

### Command

**SHOW USER PRIVILEGES**

### Syntax

```
SHOW USER[S] [name[, ...]] PRIVILEGE[S] [AS [REVOKE] COMMAND[S]]
[YIELD { * | field[, ...] } [ORDER BY field[, ...]] [SKIP n] [LIMIT n]]
[WHERE expression]
[RETURN field[, ...] [ORDER BY field[, ...]] [SKIP n] [LIMIT n]]
```

### Description

List the privileges granted to the specified users or the current user if no user is specified.

When using the `RETURN` clause, the `YIELD` clause is mandatory and may not be omitted.

For more information, see [Listing privileges](#).
### Required privilege

**GRANT SHOW PRIVILEGE**

(see [DBMS PRIVILEGE MANAGEMENT privileges](#))

**GRANT SHOW USER**

(see [DBMS USER MANAGEMENT privileges](#))

### Command

**CREATE USER**

### Syntax

```sql
CREATE USER name [IF NOT EXISTS] SET [PLAINTEXT | ENCRYPTED] PASSWORD 'password'
[[SET PASSWORD] CHANGE [NOT] REQUIRED]
[SET STATUS {ACTIVE | SUSPENDED}] [SET HOME DATABASE name]
```

**Description**

Create a new user.

For more information, see [Creating users](#).

### Required privilege

**GRANT CREATE USER**

(see [DBMS USER MANAGEMENT privileges](#))

### Command

**CREATE OR REPLACE USER**

### Syntax

```sql
CREATE OR REPLACE USER name
SET [PLAINTEXT | ENCRYPTED] PASSWORD 'password'
[[SET PASSWORD] CHANGE [NOT] REQUIRED]
[SET STATUS {ACTIVE | SUSPENDED}] [SET HOME DATABASE name]
```

**Description**

Create a new user, or if a user with the same name exists, replace it.

For more information, see [Creating users](#).

### Required privilege

**GRANT CREATE USER and GRANT DROP USER**

(see [DBMS USER MANAGEMENT privileges](#))

### Command

**RENAME USER**

### Syntax

```sql
RENAME USER name [IF EXISTS] TO otherName
```
| Description | Change the name of a user.  
For more information, see [Renaming users](#). |
|---|---|
| Required privilege | GRANT RENAME USER  
(see [DBMS USER MANAGEMENT privileges](#)) |
| Command | ALTER USER |
| Syntax | ALTER USER name [IF EXISTS]  
[SET [PLAINTEXT | ENCRYPTED] PASSWORD 'password']  
[SET PASSWORD] CHANGE [NOT] REQUIRED  
[SET STATUS {ACTIVE | SUSPENDED}]  
[SET HOME DATABASE name]  
[REMOVE HOME DATABASE] |
| Description | Modify the settings for an existing user. At least one SET or REMOVE clause is required. SET and REMOVE clauses cannot be combined in the same command.  
For more information, see [Modifying users](#). |
| Required privilege | GRANT SET PASSWORD, GRANT SET USER STATUS, and/or GRANT SET USER HOME DATABASE  
(see [DBMS USER MANAGEMENT privileges](#)) |
| Command | ALTER CURRENT USER SET PASSWORD |
| Syntax | ALTER CURRENT USER SET PASSWORD FROM 'oldPassword' TO 'newPassword' |
| Description | Change the current user’s password.  
For more information, see [Changing the current user’s password](#). |
| Required privilege | None |
| Command | DROP USER |
| Syntax | DROP USER name [IF EXISTS] |
| Description | Remove an existing user.  
For more information, see [Delete users](#). |
The SHOW USER[S] PRIVILEGES command is only available in Neo4j Enterprise Edition.

### 25.2.2. Listing current user

The currently logged-in user can be seen using `SHOW CURRENT USER` which will produce a table with the following columns:

<table>
<thead>
<tr>
<th>Column</th>
<th>Description</th>
<th>Community Edition</th>
<th>Enterprise Edition</th>
</tr>
</thead>
<tbody>
<tr>
<td>user</td>
<td>User name</td>
<td>✓</td>
<td>✓</td>
</tr>
<tr>
<td>roles</td>
<td>Roles granted to the user.</td>
<td>×</td>
<td>✓</td>
</tr>
<tr>
<td>passwordChangeRequired</td>
<td>If true, the user must change their password at the next login.</td>
<td>✓</td>
<td>✓</td>
</tr>
<tr>
<td>suspended</td>
<td>If true, the user is currently suspended (cannot log in).</td>
<td>×</td>
<td>✓</td>
</tr>
<tr>
<td>home</td>
<td>The home database configured for the user, or null if no home database has been configured. If this database is unavailable, and the user does not specify a database to use they will not be able to log in.</td>
<td>×</td>
<td>✓</td>
</tr>
</tbody>
</table>

**SHOW CURRENT USER**

**Table 459. Result**

<table>
<thead>
<tr>
<th>user</th>
<th>roles</th>
<th>passwordChangeRequired</th>
<th>suspended</th>
<th>home</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;jake&quot;</td>
<td>[&quot;PUBLIC&quot;]</td>
<td>false</td>
<td>false</td>
<td>&lt;null&gt;</td>
</tr>
</tbody>
</table>

Rows: 1

This command is only supported for a logged-in user and will return an empty result if authorization has been disabled.

### 25.2.3. Listing users

Available users can be seen using `SHOW USERS` which will produce a table of users with the following columns:
<table>
<thead>
<tr>
<th>Column</th>
<th>Description</th>
<th>Community Edition</th>
<th>Enterprise Edition</th>
</tr>
</thead>
<tbody>
<tr>
<td>user</td>
<td>User name</td>
<td>☑</td>
<td>☑</td>
</tr>
<tr>
<td>roles</td>
<td>Roles granted to the user.</td>
<td>☒</td>
<td>☑</td>
</tr>
<tr>
<td>passwordChangeRequired</td>
<td>If true, the user must change their password at the next login.</td>
<td>☑</td>
<td>☑</td>
</tr>
<tr>
<td>suspended</td>
<td>If true, the user is currently suspended (cannot log in).</td>
<td>☒</td>
<td>☑</td>
</tr>
<tr>
<td>home</td>
<td>The home database configured for the user, or null if no home database has been configured. If this database is unavailable, and the user does not specify a database to use they will not be able to log in.</td>
<td>☒</td>
<td>☑</td>
</tr>
</tbody>
</table>

Table 460. Result

<table>
<thead>
<tr>
<th>user</th>
<th>roles</th>
<th>passwordChangeRequired</th>
<th>suspended</th>
<th>home</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;neo4j&quot;</td>
<td>[&quot;admin&quot;,&quot;PUBLIC&quot;]</td>
<td>true</td>
<td>false</td>
<td>&lt;null&gt;</td>
</tr>
</tbody>
</table>

Rows: 1

When first starting a Neo4j DBMS, there is always a single default user neo4j with administrative privileges. It is possible to set the initial password using neo4j-admin set-initial-password, otherwise it is necessary to change the password after the first login.

Example 6. Show user

This example show how:

- Reorder the columns using a YIELD clause.
- Filter the results using a WHERE clause.

```
SHOW USERS YIELD user, suspended, passwordChangeRequired, roles, home
WHERE user = 'jake'
```
Example 7. Show user

It is possible to add a `RETURN` clause to further manipulate the results after filtering. In this example, the `RETURN` clause is used to filter out the `roles` column and rename the `user` column to `adminUser`.

```
SHOW USERS YIELD roles, user
WHERE 'admin' IN roles
RETURN user AS adminUser
```

The `SHOW USER name PRIVILEGES` command is described in Listing privileges.

25.2.4. Creating users

Users can be created using `CREATE USER`.

```
CREATE USER name [IF NOT EXISTS]
SET [PLAINTEXT | ENCRYPTED] PASSWORD 'password'
[[SET PASSWORD] CHANGE [NOT] REQUIRED]
[SET STATUS {ACTIVE | SUSPENDED}]
[SET HOME DATABASE name]
```

Users can be created or replaced using `CREATE OR REPLACE USER`.

```
CREATE OR REPLACE USER name
SET [PLAINTEXT | ENCRYPTED] PASSWORD 'password'
[[SET PASSWORD] CHANGE [NOT] REQUIRED]
[SET STATUS {ACTIVE | SUSPENDED}]
[SET HOME DATABASE name]
```

• For `SET PASSWORD`:
  ◦ The `password` can either be a string value or a string parameter.
  ◦ All passwords are encrypted (hashed) when stored in the Neo4j system database. `PLAINTEXT` and `ENCRYPTED` just refer to the format of the password in the Cypher command, i.e., whether Neo4j needs to hash it or it has already been hashed. Therefore, it is never possible to get the plaintext of a password back out of the database. A password can be set in either fashion at any time.
  ◦ The optional `PLAINTEXT` in `SET PLAINTEXT PASSWORD` has the same behavior as `SET PASSWORD`.
  ◦ The optional `ENCRYPTED` is used to recreate an existing user when the plaintext password is unknown, but the encrypted password is available in the `data/scripts/databasename/restore_metadata.cypher` file of a database backup. See Operations Manual → Restore a database backup → Example.

With `ENCRYPTED`, the password string is expected to be in the format of `<encryption-version>,<hash>,<salt>`, where, for example:

- 0 is the first version and refers to the SHA-256 cryptographic hash function with iterations 1.
- 1 is the second version and refers to the SHA-256 cryptographic hash function with iterations 1024.

• If the optional `SET PASSWORD CHANGE [NOT] REQUIRED` is omitted, the default is `CHANGE REQUIRED`. The
SET PASSWORD part is only optional if it directly follows the SET PASSWORD clause.

- The default for SET STATUS is ACTIVE.
- SET HOME DATABASE can be used to configure a home database for a user. If no home database is set, the DBMS default database is used as the home database for the user.
- The SET PASSWORD CHANGE [NOT] REQUIRED, SET STATUS, and SET HOME DATABASE clauses can be applied in any order.

- User names are case sensitive. The created user will appear on the list provided by SHOW USERS.
  - In Neo4j Community Edition there are no roles, but all users have implied administrator privileges.
  - In Neo4j Enterprise Edition all users are automatically assigned the PUBLIC role, giving them a base set of privileges.

**Example 8. Create user**

For example, you can create the user jake in a suspended state, with the home database anotherDb, and the requirement to change the password, using the command:

```
CREATE USER jake
SET PASSWORD 'abc' CHANGE REQUIRED
SET STATUS SUSPENDED
SET HOME DATABASE anotherDb
```

**Example 9. Create user**

Or, you can recreate the user jake in an active state, with an encrypted password (taken from the data/scripts/databasename/restore_metadata.cypher of a database backup), and the requirement not to change the password, by running:

```
CREATE USER jake
SET ENCRYPTED PASSWORD
'1,6d57a5e0b3317055454e455f96c98c750c77fb371f3f0634a1b8ff2a55c5b825,190ae47c661e0668a8e8a21ff78a4a34cdf918ca3c407e907b73932bd16c' CHANGE NOT REQUIRED
SET STATUS ACTIVE
```

The SET STATUS \{ACTIVE | SUSPENDED\} and SET HOME DATABASE parts of the commands are only available in Neo4j Enterprise Edition. 

The CREATE USER command is optionally idempotent, with the default behavior to throw an exception if the user already exists. Appending IF NOT EXISTS to the CREATE USER command will ensure that no exception is thrown and nothing happens should the user already exist.
Example 10. Create user if not exists

```sql
CREATE USER jake IF NOT EXISTS
SET PLAINTEXT PASSWORD 'xyz'
```

The `CREATE OR REPLACE USER` command will result in any existing user being deleted and a new one created.

Example 11. Create or replace user

```sql
CREATE OR REPLACE USER jake
SET PLAINTEXT PASSWORD 'xyz'
```

This is equivalent to running `DROP USER jake IF EXISTS` followed by `CREATE USER jake SET PASSWORD 'xyz'`.

The `CREATE OR REPLACE USER` command does not allow you to use the `IF NOT EXISTS`.

25.2.5. Renaming users

Users can be renamed using the `RENAME USER` command.

```sql
RENAME USER jake TO bob
```

```sql
SHOW USERS
```

<table>
<thead>
<tr>
<th>user</th>
<th>roles</th>
<th>passwordChangeRequired</th>
<th>suspended</th>
<th>home</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;bob&quot;</td>
<td>[&quot;PUBLIC&quot;]</td>
<td>true</td>
<td>false</td>
<td>&lt;null&gt;</td>
</tr>
<tr>
<td>&quot;neo4j&quot;</td>
<td>[&quot;admin&quot;,&quot;PUBLIC&quot;]</td>
<td>true</td>
<td>false</td>
<td>&lt;null&gt;</td>
</tr>
</tbody>
</table>

Rows: 2

The `RENAME USER` command is only available when using native authentication and authorization.

25.2.6. Modifying users

Users can be modified using `ALTER USER`.
ALTER USER name [IF EXISTS]
[SET [PLAINTEXT | ENCRYPTED] PASSWORD 'password']
[[SET PASSWORD] CHANGE [NOT] REQUIRED]
[SET STATUS {ACTIVE | SUSPENDED}]
[SET HOME DATABASE name]
[REMOVE HOME DATABASE name]

- At least one SET or REMOVE clause is required for the command.
- SET and REMOVE clauses cannot be combined in the same command.
- The SET PASSWORD CHANGE [NOT] REQUIRED, SET STATUS, and SET HOME DATABASE clauses can be applied in any order. The SET PASSWORD clause must come first if used.
- For SET PASSWORD:
  - The password can either be a string value or a string parameter.
  - All passwords are encrypted (hashed) when stored in the Neo4j system database. PLAINTEXT and ENCRYPTED just refer to the format of the password in the Cypher command, i.e., whether Neo4j needs to hash it or it has already been hashed. Therefore, it is never possible to get the plaintext of a password back out of the database. A password can be set in either fashion at any time.
  - The optional PLAINTEXT in SET PLAINTEXT PASSWORD has the same behavior as SET PASSWORD.
  - The optional ENCRYPTED is used to update an existing user’s password when the plaintext password is unknown, but the encrypted password is available in the data/scripts/databasename/restore_metadata.cypher file of a database backup. See Operations Manual → Restore a database backup → Example.
    With ENCRYPTED, the password string is expected to be in the format of <encryption-version>,<hash>,<salt>, where, for example:
    - 0 is the first version and refers to the SHA-256 cryptographic hash function with iterations 1.
    - 1 is the second version and refers to the SHA-256 cryptographic hash function with iterations 1024.
- If the optional SET PASSWORD CHANGE [NOT] REQUIRED is omitted, the default is CHANGE REQUIRED. The SET PASSWORD part is only optional if it directly follows the SET PASSWORD clause.
- For SET PASSWORD CHANGE [NOT] REQUIRED, the SET PASSWORD is only optional if it directly follows the SET PASSWORD clause.
- SET HOME DATABASE can be used to configure a home database for a user. If no home database is set, the DBMS default database is used as the home database for the user.
- REMOVE HOME DATABASE is used to unset the home database for a user. This results in the DBMS default database being used as the home database for the user.

For example, you can modify the user bob with a new password and active status, and remove the requirement to change his password:

```
ALTER USER bob SET PASSWORD 'abc123' CHANGE NOT REQUIRED SET STATUS ACTIVE
```

Or, you may decide to assign the user bob a different home database:
ALTER USER bob SET HOME DATABASE anotherDb

Or, remove the home database from the user bob:

ALTER USER bob REMOVE HOME DATABASE

When altering a user it is only necessary to specify the changes required. For example, leaving out the CHANGE [NOT] REQUIRED part of the query will leave that unchanged.

The SET STATUS {ACTIVE | SUSPENDED}, SET HOME DATABASE, and REMOVE HOME DATABASE parts of the command are only available in Neo4j Enterprise Edition.

The changes to the user will appear on the list provided by SHOW USERS:

SHOW USERS

<table>
<thead>
<tr>
<th>user</th>
<th>roles</th>
<th>passwordChangeRequired</th>
<th>suspended</th>
<th>home</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;bob&quot;</td>
<td>[&quot;PUBLIC&quot;]</td>
<td>false</td>
<td>false</td>
<td>&lt;null&gt;</td>
</tr>
<tr>
<td>&quot;neo4j&quot;</td>
<td>[&quot;admin&quot;,&quot;PUBLIC&quot;]</td>
<td>true</td>
<td>false</td>
<td>&lt;null&gt;</td>
</tr>
</tbody>
</table>

Rows: 2

The default behavior of this command is to throw an exception if the user does not exist. Appending an optional parameter IF EXISTS to the command makes it idempotent and ensures that no exception is thrown and nothing happens should the user not exist.

ALTER USER nonExistingUser IF EXISTS SET PASSWORD 'abc123'

25.2.7. Changing the current user’s password

Users can change their password using ALTER CURRENT USER SET PASSWORD. The old password is required in addition to the new one, and either or both can be a string value or a string parameter. When a user executes this command it will change their password as well as set the CHANGE NOT REQUIRED flag.

ALTER CURRENT USER SET PASSWORD FROM 'abc123' TO '123xyz'

This command works only for a logged-in user and cannot be run with auth disabled.

25.2.8. Delete users

Users can be deleted using DROP USER.
DROP USER bob

Deleting a user will not automatically terminate associated connections, sessions, transactions, or queries.

When a user has been deleted, it will no longer appear on the list provided by `SHOW USERS`:

```
SHOW USERS
```

<table>
<thead>
<tr>
<th>user</th>
<th>roles</th>
<th>passwordChangeRequired</th>
<th>suspended</th>
<th>home</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;neo4j&quot;</td>
<td>[&quot;admin&quot;,&quot;PUBLIC&quot;]</td>
<td>true</td>
<td>false</td>
<td>&lt;null&gt;</td>
</tr>
</tbody>
</table>

Rows: 1

25.3. Managing roles

This section explains how to use Cypher to manage roles in Neo4j.

Roles can be created and managed using a set of Cypher administration commands executed against the `system` database.

When connected to the DBMS over bolt, administration commands are automatically routed to the `system` database.

25.3.1. Role management command syntax

<table>
<thead>
<tr>
<th>Command</th>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
</table>
| SHOW ROLES                     | `SHOW [ALL | POPULATED] ROLES
  [YIELD { * | field[, ...]} [ORDER BY field[, ...]] [SKIP n] [LIMIT n]]
  [WHERE expression]
  [RETURN field[, ...] [ORDER BY field[, ...]] [SKIP n] [LIMIT n]]` | List roles.                                                                                     |
|                               |                                                                        | When using the RETURN clause, the YIELD clause is mandatory and may not be omitted.            |
|                               |                                                                        | For more information, see [Listing roles](#).                                                 |
| GRANT SHOW ROLE                | `GRANT SHOW ROLE`                                                      |                                                                                               |
|                               | (see [DBMS ROLE MANAGEMENT privileges](#))                             |                                                                                               |
| SHOW ROLES WITH USERS          |                                                                       |                                                                                               |
### Syntax

```sql
SHOW [ALL|POPULATED] ROLES WITH USERS
  [YIELD { * | field[, ...] } [ORDER BY field[, ...]] [SKIP n] [LIMIT n]]
  [WHERE expression]
  [RETURN field[, ...] [ORDER BY field[, ...]] [SKIP n] [LIMIT n]]
```

### Description

List roles and users assigned to them.

When using the `RETURN` clause, the `YIELD` clause is mandatory and may not be omitted.

For more information, see [Listing roles](#).

### Required privilege

- `GRANT SHOW ROLE`
  
  (see [DBMS ROLE MANAGEMENT privileges](#))

- `GRANT SHOW USER`
  
  (see [DBMS USER MANAGEMENT privileges](#))

### Command

```sql
SHOW ROLE PRIVILEGES
```

### Syntax

```sql
SHOW ROLE[S] name[, ...] PRIVILEGE[S] [AS [REVOKE] COMMAND[S]]
  [YIELD { * | field[, ...] } [ORDER BY field[, ...]] [SKIP n] [LIMIT n]]
  [WHERE expression]
  [RETURN field[, ...] [ORDER BY field[, ...]] [SKIP n] [LIMIT n]]
```

### Description

List the privileges granted to the specified roles.

When using the `RETURN` clause, the `YIELD` clause is mandatory and may not be omitted.

For more information, see [Listing privileges](#).

### Required privilege

- `GRANT SHOW PRIVILEGE`
  
  (see [DBMS PRIVILEGE MANAGEMENT privileges](#))

### Command

```sql
CREATE ROLE
```

### Syntax

```sql
CREATE ROLE name [IF NOT EXISTS] [AS COPY OF otherName]
```

### Description

Create a new role.

For more information, see [Creating roles](#).
<table>
<thead>
<tr>
<th>Command</th>
<th>Syntax</th>
<th>Description</th>
<th>Required privilege</th>
</tr>
</thead>
<tbody>
<tr>
<td>CREATE OR REPLACE ROLE</td>
<td>CREATE OR REPLACE ROLE name [AS COPY OF otherName]</td>
<td>Create a new role, or if a role with the same name exists, replace it.</td>
<td>GRANT CREATE ROLE and GRANT DROP ROLE (see DBMS ROLE MANAGEMENT privileges)</td>
</tr>
<tr>
<td>RENAME ROLE</td>
<td>RENAME ROLE name [IF EXISTS] TO otherName</td>
<td>Change the name of a role.</td>
<td>GRANT RENAME ROLE (see DBMS ROLE MANAGEMENT privileges)</td>
</tr>
<tr>
<td>DROP ROLE</td>
<td>DROP ROLE name [IF EXISTS]</td>
<td>Remove a role.</td>
<td>GRANT DROP ROLE (see DBMS ROLE MANAGEMENT privileges)</td>
</tr>
</tbody>
</table>
### Syntax

<table>
<thead>
<tr>
<th>Syntax</th>
<th>GRANT ROLE[S] name[, ...] TO user[, ...]</th>
</tr>
</thead>
</table>

### Description

Assign roles to users.

For more information, see Assigning roles to users.

### Required privilege

GRANT ASSIGN ROLE

(see DBMS ROLE MANAGEMENT privileges)

### Command

REVOKE ROLE

### Syntax

<table>
<thead>
<tr>
<th>Syntax</th>
<th>REVOKE ROLE[S] name[, ...] FROM user[, ...]</th>
</tr>
</thead>
</table>

### Description

Remove roles from users.

For more information, see Revoking roles from users.

### Required privilege

GRANT REMOVE ROLE

(see DBMS ROLE MANAGEMENT privileges)

### 25.3.2. Listing roles

Available roles can be seen using `SHOW ROLES`:

<table>
<thead>
<tr>
<th>SHOW ROLES</th>
</tr>
</thead>
</table>

This is the same command as `SHOW ALL ROLES`.

When first starting a Neo4j DBMS there are a number of built-in roles:

- **PUBLIC** - a role that all users have granted, by default it gives access to the home database and execute privileges for procedures and functions.
- **reader** - can perform traverse and read operations on all databases except `system`.
- **editor** - can perform traverse, read, and write operations on all databases except `system`, but cannot make new labels or relationship types.
- **publisher** - can do the same as `editor`, but also create new labels and relationship types.
- **architect** - can do the same as `publisher` as well as create and manage indexes and constraints.
- **admin** - can do the same as all the above, as well as manage databases, users, roles, and privileges.
More information about the built-in roles can be found in *Operations Manual → Built-in roles*.

There are multiple versions of this command, the default being *SHOW ALL ROLES*. To only show roles that are assigned to users, the command is *SHOW POPULATED ROLES*. To see which users are assigned to roles WITH USERS can be appended to the commands. This will give one result row for each user, so if a role is assigned to two users then it will show up twice in the result.

```
SHOW POPULATED ROLES WITH USERS
```

The table of results will show information about the role and what database it belongs to:

**Table 465. Result**

<table>
<thead>
<tr>
<th>role</th>
<th>member</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;PUBLIC&quot;</td>
<td>&quot;neo4j&quot;</td>
</tr>
<tr>
<td>&quot;PUBLIC&quot;</td>
<td>&quot;bob&quot;</td>
</tr>
<tr>
<td>&quot;PUBLIC&quot;</td>
<td>&quot;user1&quot;</td>
</tr>
<tr>
<td>&quot;PUBLIC&quot;</td>
<td>&quot;user2&quot;</td>
</tr>
<tr>
<td>&quot;PUBLIC&quot;</td>
<td>&quot;user3&quot;</td>
</tr>
<tr>
<td>&quot;admin&quot;</td>
<td>&quot;neo4j&quot;</td>
</tr>
</tbody>
</table>

Rows: 6

It is also possible to filter and sort the results by using *YIELD, ORDER BY* and *WHERE*:

```
SHOW ROLES YIELD role ORDER BY role WHERE role ENDS WITH 'r'
```

In this example:

- The results have been filtered to only return the roles ending in 'r'.
- The results are ordered by the 'action' column using *ORDER BY*.

It is also possible to use *SKIP* and *LIMIT* to paginate the results.

**Table 466. Result**
25.3.3. Creating roles

Roles can be created using `CREATE ROLE`.

```
CREATE ROLE name [IF NOT EXISTS] [AS COPY OF otherName]
```

Roles can be created or replaced by using `CREATE OR REPLACE ROLE`.

```
CREATE OR REPLACE ROLE name [AS COPY OF otherName]
```

The following naming rules apply:

- The first character must be an ASCII alphabetic character.
- Subsequent characters can be ASCII alphabetic, numeric characters, and underscore.
- Role names are case sensitive.

A role can be copied, keeping its privileges, using `CREATE ROLE name AS COPY OF otherName`.

**Example 12. Copy a role**

```
CREATE ROLE mysecondrole AS COPY OF myrole
```

Created roles will appear on the list provided by `SHOW ROLES`. 

The `SHOW ROLE name PRIVILEGES` command is found in `Listing privileges`.
Example 13. List roles

SHOW ROLES

Table 467. Result

<table>
<thead>
<tr>
<th>role</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;PUBLIC&quot;</td>
</tr>
<tr>
<td>&quot;admin&quot;</td>
</tr>
<tr>
<td>&quot;architect&quot;</td>
</tr>
<tr>
<td>&quot;editor&quot;</td>
</tr>
<tr>
<td>&quot;myrole&quot;</td>
</tr>
<tr>
<td>&quot;mysecondrole&quot;</td>
</tr>
<tr>
<td>&quot;publisher&quot;</td>
</tr>
<tr>
<td>&quot;reader&quot;</td>
</tr>
</tbody>
</table>

Rows: 8

The `CREATE ROLE` command is optionally idempotent, with the default behavior to throw an exception if the role already exists. Appending `IF NOT EXISTS` to the `CREATE ROLE` command will ensure that no exception is thrown and nothing happens should the role already exist.

Example 14. Create role if not exists

```
CREATE ROLE myrole IF NOT EXISTS
```

The `CREATE OR REPLACE ROLE` command will result in any existing role being deleted and a new one created.

Example 15. Create or replace role

```
CREATE OR REPLACE ROLE myrole
```

This is equivalent to running `DROP ROLE myrole IF EXISTS` followed by `CREATE ROLE myrole`.

- The `CREATE OR REPLACE ROLE` command does not allow you to use the `IF NOT EXISTS`.

25.3.4. Renaming roles

Roles can be renamed using `RENAME ROLE` command:
The `RENAME ROLE` command is only available when using native authentication and authorization.

### 25.3.5. Assigning roles to users

Users can be given access rights by assigning them roles using `GRANT ROLE`:

```
GRANT ROLE myrole TO bob
```

The roles assigned to each user can be seen in the list provided by `SHOW USERS`:

```
SHOW ROLES
```

#### Table 469. Result

<table>
<thead>
<tr>
<th>user</th>
<th>roles</th>
<th>passwordChangeRequired</th>
<th>suspended</th>
<th>home</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;bob&quot;</td>
<td>[&quot;myrole&quot;,&quot;PUBLIC&quot;]</td>
<td>false</td>
<td>false</td>
<td>&lt;null&gt;</td>
</tr>
<tr>
<td>&quot;neo4j&quot;</td>
<td>[&quot;admin&quot;,&quot;PUBLIC&quot;]</td>
<td>true</td>
<td>false</td>
<td>&lt;null&gt;</td>
</tr>
<tr>
<td>&quot;user1&quot;</td>
<td>[&quot;PUBLIC&quot;]</td>
<td>true</td>
<td>false</td>
<td>&lt;null&gt;</td>
</tr>
<tr>
<td>&quot;user2&quot;</td>
<td>[&quot;PUBLIC&quot;]</td>
<td>true</td>
<td>false</td>
<td>&lt;null&gt;</td>
</tr>
<tr>
<td>&quot;user3&quot;</td>
<td>[&quot;PUBLIC&quot;]</td>
<td>true</td>
<td>false</td>
<td>&lt;null&gt;</td>
</tr>
</tbody>
</table>

Rows: 5

It is possible to assign multiple roles to multiple users in one command:
GRANT ROLES role1, role2 TO user1, user2, user3

SHOW ROLES

### Table 470. Result

<table>
<thead>
<tr>
<th>user</th>
<th>roles</th>
<th>passwordChangeRequired</th>
<th>suspended</th>
<th>home</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;bob&quot;</td>
<td>[&quot;myrole&quot;,&quot;PUBLIC&quot;]</td>
<td>false</td>
<td>false</td>
<td>&lt;null&gt;</td>
</tr>
<tr>
<td>&quot;neo4j&quot;</td>
<td>[&quot;admin&quot;,&quot;PUBLIC&quot;]</td>
<td>true</td>
<td>false</td>
<td>&lt;null&gt;</td>
</tr>
<tr>
<td>&quot;user1&quot;</td>
<td>[&quot;role1&quot;,&quot;role2&quot;,&quot;PUBLIC&quot;]</td>
<td>true</td>
<td>false</td>
<td>&lt;null&gt;</td>
</tr>
<tr>
<td>&quot;user2&quot;</td>
<td>[&quot;role1&quot;,&quot;role2&quot;,&quot;PUBLIC&quot;]</td>
<td>true</td>
<td>false</td>
<td>&lt;null&gt;</td>
</tr>
<tr>
<td>&quot;user3&quot;</td>
<td>[&quot;role1&quot;,&quot;role2&quot;,&quot;PUBLIC&quot;]</td>
<td>true</td>
<td>false</td>
<td>&lt;null&gt;</td>
</tr>
</tbody>
</table>

Rows: 5

#### 25.3.6. Revoking roles from users

Users can lose access rights by revoking their role using REVOKE ROLE:

```
REVOKE ROLE myrole FROM bob
```

The roles revoked from users can no longer be seen in the list provided by SHOW USERS:

SHOW ROLES

### Table 471. Result

<table>
<thead>
<tr>
<th>user</th>
<th>roles</th>
<th>passwordChangeRequired</th>
<th>suspended</th>
<th>home</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;bob&quot;</td>
<td>[&quot;PUBLIC&quot;]</td>
<td>false</td>
<td>false</td>
<td>&lt;null&gt;</td>
</tr>
<tr>
<td>&quot;neo4j&quot;</td>
<td>[&quot;admin&quot;,&quot;PUBLIC&quot;]</td>
<td>true</td>
<td>false</td>
<td>&lt;null&gt;</td>
</tr>
<tr>
<td>&quot;user1&quot;</td>
<td>[&quot;role1&quot;,&quot;role2&quot;,&quot;PUBLIC&quot;]</td>
<td>true</td>
<td>false</td>
<td>&lt;null&gt;</td>
</tr>
<tr>
<td>&quot;user2&quot;</td>
<td>[&quot;role1&quot;,&quot;role2&quot;,&quot;PUBLIC&quot;]</td>
<td>true</td>
<td>false</td>
<td>&lt;null&gt;</td>
</tr>
<tr>
<td>&quot;user3&quot;</td>
<td>[&quot;role1&quot;,&quot;role2&quot;,&quot;PUBLIC&quot;]</td>
<td>true</td>
<td>false</td>
<td>&lt;null&gt;</td>
</tr>
</tbody>
</table>

Rows: 5

It is possible to revoke multiple roles from multiple users in one command:

```
REVOKE ROLES role1, role2 FROM user1, user2, user3
```

#### 25.3.7. Deleting roles

Roles can be deleted using DROP ROLE command:
When a role has been deleted, it will no longer appear on the list provided by `SHOW ROLES`:

```
SHOW ROLES
```

### Table 472. Result

<table>
<thead>
<tr>
<th>role</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;PUBLIC&quot;</td>
</tr>
<tr>
<td>&quot;admin&quot;</td>
</tr>
<tr>
<td>&quot;architect&quot;</td>
</tr>
<tr>
<td>&quot;editor&quot;</td>
</tr>
<tr>
<td>&quot;myrole&quot;</td>
</tr>
<tr>
<td>&quot;publisher&quot;</td>
</tr>
<tr>
<td>&quot;reader&quot;</td>
</tr>
</tbody>
</table>

Rows: 8

This command is optionally idempotent, with the default behavior to throw an exception if the role does not exist. Appending `IF EXISTS` to the command will ensure that no exception is thrown and nothing happens should the role not exist:

```
DROP ROLE mythirdrole IF EXISTS
```

### 25.4. Managing privileges

This section explains how to use Cypher to manage privileges for Neo4j role-based access control and fine-grained security.

Privileges control the access rights to graph elements using a combined allowlist/denylist mechanism. It is possible to grant access, or deny access, or a combination of the two. The user will be able to access the resource if they have a grant (whitelist) and do not have a deny (blacklist) relevant to that resource. All other combinations of `GRANT` and `DENY` will result in the matching path being inaccessible. What this means in practice depends on whether we are talking about a read privilege or a write privilege.

- If a entity is not accessible due to read privileges, the data will become invisible to attempts to read it. It will appear to the user as if they have a smaller database (smaller graph).
- If an entity is not accessible due to write privileges, an error will occur on any attempt to write that data.
In this document we will often use the terms 'allows' and 'enables' in seemingly identical ways. However, there is a subtle difference. We will use 'enables' to refer to the consequences of read privileges where a restriction will not cause an error, only a reduction in the apparent graph size. We will use 'allows' to refer to the consequence of write privileges where a restriction can result in an error.

If a user was not also provided with the database ACCESS privilege then access to the entire database will be denied. Information about the database access privilege can be found in The ACCESS privilege.

25.4.1. Graph privilege commands (GRANT, DENY and REVOKE) Enterprise edition

Administrators can use Cypher commands to manage Neo4j graph administrative rights. The components of the graph privilege commands are:

- the command:
  - GRANT – gives privileges to roles.
  - DENY – denies privileges to roles.
  - REVOKE – removes granted or denied privilege from roles.
- graph-privilege
  - Can be either a read privilege or write privilege.
- name
  - The graph or graphs to associate the privilege with. Because in Neo4j 4.3 you can have only one graph per database, this command uses the database name to refer to that graph.
    - It can be * which means all graphs. Graphs created after this command execution will also be associated with these privileges.
    - HOME GRAPH refers to the graph associated with the home database for that user. The default database will be used as home database if a user does not have a home database configured. If the user’s home database changes for any reason after privileges have been created then these privileges will be associated with the graph attached to the new database. This can be quite powerful as it allows permissions to be switched from one graph to another simply by changing a user’s home database.
- entity
  - The graph elements this privilege applies to:
    - NODES label (nodes with the specified label(s)).
    - RELATIONSHIPS type (relationships of the specific type(s)).
The label or type can be * which means all labels or types. Multiple labels or types can be specified, comma-separated. Defaults to ELEMENTS * if omitted. Some of the commands for write privileges do not allow an entity part, see Write privileges for details.

- role[,...]
  - The role or roles to associate the privilege with, comma-separated.

### Table 473. General graph privilege command syntax

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>GRANT graph-privilege ON {HOME GRAPH</td>
<td>GRAPH[S] [*</td>
</tr>
<tr>
<td>DENY graph-privilege ON {HOME GRAPH</td>
<td>GRAPH[S] [*</td>
</tr>
<tr>
<td>REVOKE GRANT graph-privilege ON {HOME GRAPH</td>
<td>GRAPH[S] [*</td>
</tr>
<tr>
<td>REVOKE DENY graph-privilege ON {HOME GRAPH</td>
<td>GRAPH[S] [*</td>
</tr>
<tr>
<td>REVOKE graph-privilege ON {HOME GRAPH</td>
<td>GRAPH[S] [*</td>
</tr>
</tbody>
</table>

DENY does NOT erase a granted privilege; they both exist. Use REVOKE if you want to remove a privilege.

The general grant and deny syntax is illustrated in the following image:

![Figure 1. GRANT and DENY Syntax](image-url)
A more detailed syntax illustration would be the following image for graph privileges:

![Syntax Illustration](image-url)

Figure 2. Syntax of GRANT and DENY Graph Privileges. The { and } are part of the syntax and not used for grouping.

The following image shows the hierarchy between the different graph privileges:

![Hierarchy Illustration](image-url)

Figure 3. Graph privileges hierarchy

### 25.4.2. Listing privileges

Available privileges can be displayed using the different `SHOW PRIVILEGES` commands.

#### Table 474. Show privileges command syntax

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>SHOW [ALL] PRIVILEGE[S] [AS [REVOKE] COMMAND[S]]</code></td>
<td>List all privileges.</td>
</tr>
<tr>
<td>`[YIELD { *</td>
<td>field[, ...] } [ORDER BY field[, ...]] [SKIP n] [LIMIT n]]`</td>
</tr>
<tr>
<td><code>[WHERE expression]</code></td>
<td></td>
</tr>
<tr>
<td><code>[RETURN field[, ...] [ORDER BY field[, ...]] [SKIP n] [LIMIT n]]</code></td>
<td></td>
</tr>
</tbody>
</table>
When using the RETURN clause, the YIELD clause is mandatory and may not be omitted.

For an easy overview of the existing privileges, it is recommended to use the AS COMMANDS version of the show command. This returns the privileges as the commands that are granted or denied.

Omitting the AS COMMANDS clause instead gives the result as multiple columns describing the privilege:

- **access**: whether the privilege is granted or denied.
- **action**: which type of privilege this is, for example traverse, read, index management, or role management.
- **resource**: what type of scope this privilege applies to: the entire dbms, a database, a graph or sub-graph access.
- **graph**: the specific database or graph this privilege applies to.
- **segment**: when applicable, the scope this privilege applies to: labels, relationship types, procedures, functions, or transactions.
- **role**: the role the privilege is granted to.
Examples for listing all privileges

Available privileges can be displayed using the different `SHOW PRIVILEGES` commands.

### Command syntax

```
SHOW [ALL] PRIVILEGE[S] [AS [REVOKE] COMMAND[S]]
[WHERE expression]
```

```
SHOW [ALL] PRIVILEGE[S] [AS [REVOKE] COMMAND[S]]
YIELD { * | field[, ...] } [ORDER BY field[, ...]] [SKIP n] [LIMIT n]
[WHERE expression]
[RETURN field[, ...] [ORDER BY field[, ...]] [SKIP n] [LIMIT n]]
```

```
SHOW PRIVILEGES
```

Lists all privileges for all roles:

### Table 475. Result

<table>
<thead>
<tr>
<th>access</th>
<th>action</th>
<th>resource</th>
<th>graph</th>
<th>segment</th>
<th>role</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;GRANTED&quot;</td>

<td>&quot;*&quot;</td>
<td>&quot;database&quot;</td>
<td>&quot;architect&quot;</td>
</tr>
<tr>
<td>&quot;GRANTED&quot;</td>
<td>&quot;token&quot;</td>
<td>&quot;database&quot;</td>
<td>&quot;*&quot;</td>
<td>&quot;database&quot;</td>
<td>&quot;architect&quot;</td>
</tr>
</tbody>
</table>

439
## Show Privileges

It is also possible to filter and sort the results by using **YIELD**, **ORDER BY** and **WHERE**:

```sql
SHOW PRIVILEGES YIELD role, access, action, segment ORDER BY action WHERE role = 'admin'
```

In this example:

- The number of columns returned has been reduced with the **YIELD** clause.
- The order of the returned columns has been changed.
- The results have been filtered to only return the **admin** role using a **WHERE** clause.
- The results are ordered by the **action** column using **ORDER BY**.

**SKIP** and **LIMIT** can also be used to paginate the results.

### Table 476. Result

<table>
<thead>
<tr>
<th>role</th>
<th>access</th>
<th>action</th>
<th>segment</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;admin&quot;</td>
<td>&quot;GRANTED&quot;</td>
<td>&quot;access&quot;</td>
<td>&quot;database&quot;</td>

<td>&quot;access&quot;</td>
<td>&quot;neo4j&quot;</td>
<td>&quot;database&quot;</td>
<td>&quot;regularUsers&quot;</td>
<td>&quot;database&quot;</td>
</tr>
</tbody>
</table>

Rows: 3

WHERE can be used without YIELD:

SHOW PRIVILEGES WHERE graph <> 'x'

In this example, the WHERE clause is used to filter privileges down to those that target specific graphs only.

Table 477. Result

Aggregations in the RETURN clause can be used to group privileges. In this case, by user and granted / denied:

SHOW PRIVILEGES YIELD * RETURN role, access, collect([graph, resource, segment, action]) as privileges

Table 478. Result
The `RETURN` clause can also be used to order and paginate the results, which is useful when combined with `YIELD` and `WHERE`. In this example the query returns privileges for display five-per-page, and skips the first five to display the second page.

```
SHOW PRIVILEGES YIELD * RETURN * ORDER BY role SKIP 5 LIMIT 5
```

Table 479. Result

<table>
<thead>
<tr>
<th>access</th>
<th>action</th>
<th>graph</th>
<th>resource</th>
<th>role</th>
<th>segment</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;GRANTED&quot;</td>
<td>&quot;match&quot;</td>
<td>&quot;*&quot;</td>
<td>&quot;all_properties&quot;</td>
<td>&quot;admin&quot;</td>
<td>&quot;RELATIONSHIP(*)&quot;</td>
</tr>
<tr>
<td>&quot;GRANTED&quot;</td>
<td>&quot;write&quot;</td>
<td>&quot;*&quot;</td>
<td>&quot;graph&quot;</td>
<td>&quot;admin&quot;</td>
<td>&quot;RELATIONSHIP(*)&quot;</td>
</tr>
<tr>
<td>&quot;GRANTED&quot;</td>
<td>&quot;transaction_management&quot;</td>
<td>&quot;*&quot;</td>
<td>&quot;database&quot;</td>
<td>&quot;admin&quot;</td>
<td>&quot;USER(*)&quot;</td>
</tr>
<tr>
<td>&quot;GRANTED&quot;</td>
<td>&quot;access&quot;</td>
<td>&quot;*&quot;</td>
<td>&quot;database&quot;</td>
<td>&quot;admin&quot;</td>
<td>&quot;database&quot;</td>
</tr>
<tr>
<td>&quot;GRANTED&quot;</td>
<td>&quot;constraint&quot;</td>
<td>&quot;*&quot;</td>
<td>&quot;database&quot;</td>
<td>&quot;admin&quot;</td>
<td>&quot;database&quot;</td>
</tr>
</tbody>
</table>

Rows: 5

Available privileges can also be output as Cypher commands, by appending `AS COMMAND[S]` to the show command:

```
SHOW PRIVILEGES AS COMMANDS
```

Table 480. Result

<table>
<thead>
<tr>
<th>command</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;DENY ACCESS ON DATABASE neo4j TO 'noAccessUsers'&quot;</td>
</tr>
</tbody>
</table>

442
command

"GRANT ACCESS ON DATABASE * TO 'admin'
"GRANT ACCESS ON DATABASE * TO 'architect'
"GRANT ACCESS ON DATABASE * TO 'editor'
"GRANT ACCESS ON DATABASE * TO 'publisher'
"GRANT ACCESS ON DATABASE * TO 'reader'
"GRANT ACCESS ON DATABASE neo4j TO 'regularUsers'
"GRANT ALL DBMS PRIVILEGES ON DBMS TO 'admin'
"GRANT CONSTRAINT MANAGEMENT ON DATABASE * TO 'admin'
"GRANT CONSTRAINT MANAGEMENT ON DATABASE * TO 'architect'
"GRANT EXECUTE FUNCTION * ON DBMS TO 'PUBLIC'
"GRANT EXECUTE PROCEDURE * ON DBMS TO 'PUBLIC'

"GRANT WRITE ON GRAPH * TO 'admin'
"GRANT WRITE ON GRAPH * TO 'architect'
"GRANT WRITE ON GRAPH * TO 'editor'
"GRANT WRITE ON GRAPH * TO 'publisher'

Rows: 35

Like other SHOW commands, the output can also be processed using YIELD / WHERE / RETURN:
SHOW PRIVILEGES AS COMMANDS WHERE command CONTAINS 'MANAGEMENT'

Table 481. Result

<table>
<thead>
<tr>
<th>command</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;GRANT CONSTRAINT MANAGEMENT ON DATABASE * TO 'admin'&quot;</td>
</tr>
<tr>
<td>&quot;GRANT CONSTRAINT MANAGEMENT ON DATABASE * TO 'architect'&quot;</td>
</tr>
<tr>
<td>&quot;GRANT INDEX MANAGEMENT ON DATABASE * TO 'admin'&quot;</td>
</tr>
<tr>
<td>&quot;GRANT INDEX MANAGEMENT ON DATABASE * TO 'architect'&quot;</td>
</tr>
<tr>
<td>&quot;GRANT NAME MANAGEMENT ON DATABASE * TO 'admin'&quot;</td>
</tr>
<tr>
<td>&quot;GRANT NAME MANAGEMENT ON DATABASE * TO 'architect'&quot;</td>
</tr>
<tr>
<td>&quot;GRANT NAME MANAGEMENT ON DATABASE * TO 'publisher'&quot;</td>
</tr>
<tr>
<td>&quot;GRANT TRANSACTION MANAGEMENT (*) ON DATABASE * TO 'admin'&quot;</td>
</tr>
</tbody>
</table>

Rows: 8

It is also possible to get the privilege commands formatted for revoking instead of granting or denying the privileges:

SHOW PRIVILEGES AS REVOKE COMMANDS

Table 482. Result

<table>
<thead>
<tr>
<th>command</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;REVOKE DENY ACCESS ON DATABASE neo4j FROM 'noAccessUsers'&quot;</td>
</tr>
<tr>
<td>&quot;REVOKE GRANT ACCESS ON DATABASE * FROM 'admin'&quot;</td>
</tr>
<tr>
<td>&quot;REVOKE GRANT ACCESS ON DATABASE * FROM 'architect'&quot;</td>
</tr>
<tr>
<td>&quot;REVOKE GRANT ACCESS ON DATABASE * FROM 'editor'&quot;</td>
</tr>
<tr>
<td>&quot;REVOKE GRANT ACCESS ON DATABASE * FROM 'publisher'&quot;</td>
</tr>
<tr>
<td>&quot;REVOKE GRANT ACCESS ON DATABASE * FROM 'reader'&quot;</td>
</tr>
<tr>
<td>&quot;REVOKE GRANT ACCESS ON DATABASE neo4j FROM 'regularUsers'&quot;</td>
</tr>
<tr>
<td>&quot;REVOKE GRANT ACCESS ON HOME DATABASE FROM 'PUBLIC'&quot;</td>
</tr>
<tr>
<td>&quot;REVOKE GRANT ALL DBMS PRIVILEGES ON DBMS FROM 'admin'&quot;</td>
</tr>
<tr>
<td>&quot;REVOKE GRANT CONSTRAINT MANAGEMENT ON DATABASE * FROM 'admin'&quot;</td>
</tr>
<tr>
<td>&quot;REVOKE GRANT CONSTRAINT MANAGEMENT ON DATABASE * FROM 'architect'&quot;</td>
</tr>
<tr>
<td>&quot;REVOKE GRANT EXECUTE FUNCTION * ON DBMS FROM 'PUBLIC'&quot;</td>
</tr>
<tr>
<td>&quot;REVOKE GRANT EXECUTE PROCEDURE * ON DBMS FROM 'PUBLIC'&quot;</td>
</tr>
<tr>
<td>&quot;REVOKE GRANT INDEX MANAGEMENT ON DATABASE * FROM 'admin'&quot;</td>
</tr>
<tr>
<td>&quot;REVOKE GRANT INDEX MANAGEMENT ON DATABASE * FROM 'architect'&quot;</td>
</tr>
<tr>
<td>&quot;REVOKE GRANT MATCH {*} ON GRAPH * NODE * FROM 'admin'&quot;</td>
</tr>
<tr>
<td>&quot;REVOKE GRANT MATCH {*} ON GRAPH * NODE * FROM 'architect'&quot;</td>
</tr>
</tbody>
</table>
For more info about revoking privileges, please see The REVOKE command.

Examples for listing privileges for specific roles

Available privileges for specific roles can be displayed using SHOW ROLE name PRIVILEGES.

```
SHOW ROLE[s] name[, ...] PRIVILEGE[s] [AS [REVOKE] COMMAND[s]]
     [WHERE expression]
SHOW ROLE[s] name[, ...] PRIVILEGE[s] [AS [REVOKE] COMMAND[s]]
     YIELD { * | field[, ...] } [ORDER BY field[, ...]] [SKIP n] [LIMIT n]
     [WHERE expression]
     [RETURN field[, ...] [ORDER BY field[, ...]] [SKIP n] [LIMIT n]]
```

SHOW ROLE regularUsers PRIVILEGES

Lists all privileges for role regularUsers.

Table 483. Result

<table>
<thead>
<tr>
<th>access</th>
<th>action</th>
<th>graph</th>
<th>resource</th>
<th>role</th>
<th>segment</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;GRANTED&quot;</td>
<td>&quot;access&quot;</td>
<td>&quot;database&quot;</td>
<td>&quot;neo4j&quot;</td>
<td>&quot;database&quot;</td>
<td>&quot;regularUsers&quot;</td>
</tr>
</tbody>
</table>
SHOW ROLES regularUsers, noAccessUsers PRIVILEGES

Lists all privileges for roles regularUsers and noAccessUsers.

Table 484. Result

<table>
<thead>
<tr>
<th>access</th>
<th>action</th>
<th>graph</th>
<th>resource</th>
<th>role</th>
<th>segment</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;DENIED&quot;</td>
<td>&quot;access&quot;</td>
<td>&quot;database&quot;</td>
<td>&quot;neo4j&quot;</td>
<td>&quot;database&quot;</td>
<td>&quot;noAccessUsers&quot;</td>
</tr>
<tr>
<td>&quot;GRANTED&quot;</td>
<td>&quot;access&quot;</td>
<td>&quot;database&quot;</td>
<td>&quot;neo4j&quot;</td>
<td>&quot;database&quot;</td>
<td>&quot;regularUsers&quot;</td>
</tr>
</tbody>
</table>

Rows: 2

Similar to the other show privilege commands, the available privileges for roles can also be output as Cypher commands with the optional AS COMMAND[S].

Table 485. Result

<table>
<thead>
<tr>
<th>command</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;GRANT ACCESS ON DATABASE * TO <code>admin</code>&quot;</td>
</tr>
<tr>
<td>&quot;GRANT ALL DBMS PRIVILEGES ON DBMS TO <code>admin</code>&quot;</td>
</tr>
<tr>
<td>&quot;GRANT CONSTRAINT MANAGEMENT ON DATABASE * TO <code>admin</code>&quot;</td>
</tr>
<tr>
<td>&quot;GRANT INDEX MANAGEMENT ON DATABASE * TO <code>admin</code>&quot;</td>
</tr>
<tr>
<td>&quot;GRANT MATCH (*) ON GRAPH * NODE * TO <code>admin</code>&quot;</td>
</tr>
<tr>
<td>&quot;GRANT MATCH (*) ON GRAPH * RELATIONSHIP * TO <code>admin</code>&quot;</td>
</tr>
<tr>
<td>&quot;GRANT NAME MANAGEMENT ON DATABASE * TO <code>admin</code>&quot;</td>
</tr>
<tr>
<td>&quot;GRANT START ON DATABASE * TO <code>admin</code>&quot;</td>
</tr>
<tr>

</tr>
<tr>
<td>&quot;GRANT TRANSACTION MANAGEMENT (*) ON DATABASE * TO <code>admin</code>&quot;</td>
</tr>
<tr>
<td>&quot;GRANT WRITE ON GRAPH * TO <code>admin</code>&quot;</td>
</tr>
</tbody>
</table>

Rows: 11

The output can be processed using YIELD / WHERE / RETURN here as well.

SHOW ROLE architect PRIVILEGES AS COMMANDS WHERE command CONTAINS 'MATCH'

Table 486. Result

<table>
<thead>
<tr>
<th>command</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;GRANT MATCH (*) ON GRAPH * NODE * TO <code>architect</code>&quot;</td>
</tr>
</tbody>
</table>
command

"GRANT MATCH {*} ON GRAPH * RELATIONSHIP * TO 'architect'"

Rows: 2

Again, is it possible to get the privilege commands formatted for revoking instead of granting or denying the privileges. For more info about revoking privileges, please see The REVOKE command.

SHOW ROLE reader PRIVILEGES AS REVOKE COMMANDS

Table 487. Result

command

"REVOKE GRANT ACCESS ON DATABASE * FROM 'reader'"

"REVOKE GRANT MATCH {*} ON GRAPH * NODE * FROM 'reader'"

"REVOKE GRANT MATCH {*} ON GRAPH * RELATIONSHIP * FROM 'reader'"

Rows: 3

Examples for listing privileges for specific users

Available privileges for specific users can be displayed using SHOW USER name PRIVILEGES.

Please note that if a non-native auth provider like LDAP is in use, SHOW USER PRIVILEGES will only work in a limited capacity; It is only possible for a user to show their own privileges. Other users' privileges cannot be listed when using a non-native auth provider.

SHOW USER[S] [name[, ...]] PRIVILEGE[S] [AS [REVOKE COMMAND[S]]]
[WHERE expression]

SHOW USER[S] [name[, ...]] PRIVILEGE[S] [AS [REVOKE COMMAND[S]]]
[WHERE expression]
YIELD { * | field[, ...] } [ORDER BY field[, ...]] [SKIP n] [LIMIT n]
[WHERE expression]
[RETURN field[, ...] [ORDER BY field[, ...]] [SKIP n] [LIMIT n]]

SHOW USER jake PRIVILEGES

Table 488. Result

<table>
<thead>

<td>&quot;neo4j&quot;</td>
<td>&quot;database&quot;</td>
<td>&quot;noAccessUsers&quot;</td>
<td>&quot;joe&quot;</td>
</tr>
</tbody>
</table>

Rows: 8

The same command can be used at all times to review available privileges for the current user. For this purpose, a shorter form of the command also exists: SHOW USER PRIVILEGES

SHOW USER PRIVILEGES

As for the other privilege commands, available privileges for users can also be output as Cypher commands with the optional AS COMMAND[S].

When showing user privileges as commands, the roles in the Cypher commands are replaced with a parameter. This can be used to quickly create new roles based on the privileges of specific users.

SHOW USER jake PRIVILEGES AS COMMANDS

Table 490. Result

<table>
<thead>
<tr>
<th>command</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;GRANT ACCESS ON DATABASE neo4j TO $role&quot;</td>
</tr>
<tr>
<td>&quot;GRANT ACCESS ON HOME DATABASE TO $role&quot;</td>
</tr>
<tr>
<td>&quot;GRANT EXECUTE FUNCTION * ON DBMS TO $role&quot;</td>
</tr>
<tr>
<td>&quot;GRANT EXECUTE PROCEDURE * ON DBMS TO $role&quot;</td>
</tr>
</tbody>
</table>
Like other SHOW commands, the output can also be processed using YIELD / WHERE / RETURN. Additionally, similar to the other show privilege commands, it is also possible to show the commands for revoking the privileges.

```sql
SHOW USER jake PRIVILEGES AS REVOKE COMMANDS WHERE command CONTAINS 'EXECUTE'
```

**Table 491. Result**

<table>
<thead>
<tr>
<th>command</th>
<th>Rows: 2</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;REVOKE GRANT EXECUTE FUNCTION * ON DBMS FROM $role&quot;</td>
<td></td>
</tr>
<tr>
<td>&quot;REVOKE GRANT EXECUTE PROCEDURE * ON DBMS FROM $role&quot;</td>
<td></td>
</tr>
</tbody>
</table>

25.4.3. Revoking privileges [Enterprise edition](#)

Privileges that were granted or denied earlier can be revoked using the REVOKE command:

```sql
REVOKE [ GRANT | DENY ] graph-privilege FROM role[, ...]
```

An example usage of the REVOKE command is given here:

```sql
REVOKE GRANT TRAVERSE ON HOME GRAPH NODES Post FROM regularUsers
```

While it can be explicitly specified that revoke should remove a GRANT or DENY, it is also possible to revoke either one by not specifying at all as the next example demonstrates. Because of this, if there happen to be a GRANT and a DENY on the same privilege, it would remove both.

```sql
REVOKE TRAVERSE ON HOME GRAPH NODES Payments FROM regularUsers
```

25.5. Built-in roles and privileges [Enterprise edition](#)

This section explains the default privileges of the built-in roles in Neo4j and how to recreate them if needed.

All of the commands described in this chapter require that the user executing the commands has the rights to do so. The privileges listed in the following sections are the default set of privileges for each built-in role:

- The PUBLIC role
• The reader role
• The editor role
• The publisher role
• The architect role
• The admin role

25.5.1. The PUBLIC role

All users are granted the PUBLIC role, and it cannot be revoked or dropped. By default, it gives access to the default database and allows executing all procedures and user defined functions.

| The PUBLIC role cannot be dropped or revoked from any user, but the specific privileges for the role may be modified. In contrast to the PUBLIC role, the other built-in roles can be granted, revoked, dropped, and re-created. |

Listing PUBLIC role privileges

SHOW ROLE PUBLIC PRIVILEGES AS COMMANDS

<table>
<thead>
<tr>
<th>Table 492. Result</th>
</tr>
</thead>
<tbody>
<tr>
<td>command</td>
</tr>
<tr>
<td>&quot;GRANT ACCESS ON HOME DATABASE TO <code>PUBLIC</code>&quot;</td>
</tr>
<tr>
<td>&quot;GRANT EXECUTE FUNCTION * ON DBMS TO <code>PUBLIC</code>&quot;</td>
</tr>
<tr>
<td>&quot;GRANT EXECUTE PROCEDURE * ON DBMS TO <code>PUBLIC</code>&quot;</td>
</tr>
<tr>
<td>Rows: 3</td>
</tr>
</tbody>
</table>

Recreating the PUBLIC role

The PUBLIC role can not be dropped and thus there is no need to recreate the role itself. To restore the role to its original capabilities, two steps are needed. First, all GRANT or DENY privileges on this role should be revoked (see output of SHOW ROLE PUBLIC PRIVILEGES AS REVOKE COMMANDS on what to revoke). Secondly, the following queries must be run:

| GRANT ACCESS ON HOME DATABASE TO PUBLIC |
| GRANT EXECUTE PROCEDURES * ON DBMS TO PUBLIC |
| GRANT EXECUTE USER DEFINED FUNCTIONS * ON DBMS TO PUBLIC |

The resulting PUBLIC role now has the same privileges as the original built-in PUBLIC role.
25.5.2. The **reader** role

The **reader** role can perform read-only queries on all graphs except for the **system** database.

Listing **reader** role privileges

```sql
SHOW ROLE reader PRIVILEGES AS COMMANDS
```

<table>
<thead>
<tr>
<th>command</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;GRANT ACCESS ON DATABASE * TO <code>reader</code>&quot;</td>
</tr>
<tr>
<td>&quot;GRANT MATCH {(*) ON GRAPH NODE * TO <code>reader</code>}&quot;</td>
</tr>
<tr>
<td>&quot;GRANT MATCH {(*) ON GRAPH RELATIONSHIP * TO <code>reader</code>}&quot;</td>
</tr>
</tbody>
</table>

**Table 493. Result**

Rows: 3

Recreating the **reader** role

To restore the role to its original capabilities two steps are needed. First, if not already done, execute **DROP ROLE reader**. Secondly, the following queries must be run:

```sql
CREATE ROLE reader
GRANT ACCESS ON DATABASE * TO reader
GRANT MATCH {(*) ON GRAPH * TO reader}
```

The resulting **reader** role now has the same privileges as the original built-in **reader** role.

25.5.3. The **editor** role

The **editor** role can perform read and write operations on all graphs except for the **system** database, but can not make new labels, property keys or relationship types.

Listing **editor** role privileges

```sql
SHOW ROLE editor PRIVILEGES AS COMMANDS
```

<table>
<thead>
<tr>
<th>command</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;GRANT ACCESS ON DATABASE * TO <code>editor</code>&quot;</td>
</tr>
<tr>
<td>&quot;GRANT MATCH {(*) ON GRAPH NODE * TO <code>editor</code>}&quot;</td>
</tr>
</tbody>
</table>

**Table 494. Result**
Recreating the editor role

To restore the role to its original capabilities two steps are needed. First, if not already done, execute DROP ROLE editor. Secondly, the following queries must be run:

<table>
<thead>
<tr>
<th>command</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;GRANT MATCH {*} ON GRAPH * RELATIONSHIP * TO 'editor'&quot;</td>
</tr>
<tr>
<td>&quot;GRANT WRITE ON GRAPH * TO 'editor'&quot;</td>
</tr>
</tbody>
</table>

Rows: 4

The resulting editor role now has the same privileges as the original built-in editor role.

25.5.4. The publisher role

The publisher role can do the same as editor, but can also create new labels, property keys and relationship types.

Listing publisher role privileges

<table>
<thead>
<tr>
<th>command</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;GRANT ACCESS ON DATABASE * TO 'publisher'&quot;</td>
</tr>
<tr>
<td>&quot;GRANT MATCH {*} ON GRAPH * NODE * TO 'publisher'&quot;</td>
</tr>
<tr>
<td>&quot;GRANT NAME MANAGEMENT ON DATABASE * TO 'publisher'&quot;</td>
</tr>
<tr>
<td>&quot;GRANT WRITE ON GRAPH * TO 'publisher'&quot;</td>
</tr>
</tbody>
</table>

Rows: 5
Recreating the **publisher** role

To restore the role to its original capabilities two steps are needed. First, if not already done, execute `DROP ROLE publisher`. Secondly, the following queries must be run:

```sql
CREATE ROLE publisher

GRANT ACCESS ON DATABASE * TO publisher

GRANT MATCH (*) ON GRAPH * TO publisher

GRANT WRITE ON GRAPH * TO publisher

GRANT NAME MANAGEMENT ON DATABASE * TO publisher
```

The resulting `publisher` role now has the same privileges as the original built-in `publisher` role.

25.5.5. The **architect** role

The **architect** role can do the same as the **publisher**, as well as create and manage indexes and constraints.

Listing **architect** role privileges

```sql
SHOW ROLE architect PRIVILEGES AS COMMANDS
```

Table 496. Result

<table>
<thead>
<tr>
<th>command</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;GRANT ACCESS ON DATABASE * TO <code>architect</code>&quot;</td>
</tr>
<tr>
<td>&quot;GRANT CONSTRAINT MANAGEMENT ON DATABASE * TO <code>architect</code>&quot;</td>
</tr>
<tr>
<td>&quot;GRANT INDEX MANAGEMENT ON DATABASE * TO <code>architect</code>&quot;</td>
</tr>
<tr>
<td>&quot;GRANT MATCH (*) ON GRAPH * NODE * TO <code>architect</code>&quot;</td>
</tr>
<tr>
<td>&quot;GRANT MATCH (*) ON GRAPH * RELATIONSHIP * TO <code>architect</code>&quot;</td>
</tr>
<tr>
<td>&quot;GRANT NAME MANAGEMENT ON DATABASE * TO <code>architect</code>&quot;</td>
</tr>
<tr>
<td>&quot;GRANT WRITE ON GRAPH * TO <code>architect</code>&quot;</td>
</tr>
</tbody>
</table>

Rows: 7

Recreating the **architect** role

To restore the role to its original capabilities two steps are needed. First, if not already done, execute `DROP ROLE architect`. Secondly, the following queries must be run:
GRANT ACCESS ON DATABASE * TO architect

GRANT MATCH (*) ON GRAPH * TO architect

GRANT WRITE ON GRAPH * TO architect

GRANT NAME MANAGEMENT ON DATABASE * TO architect

GRANT INDEX MANAGEMENT ON DATABASE * TO architect

GRANT CONSTRAINT MANAGEMENT ON DATABASE * TO architect

The resulting architect role now has the same privileges as the original built-in architect role.

25.5.6. The admin role

The admin role can do the same as the architect, as well as manage databases, users, roles and privileges.

The admin role has the ability to perform administrative tasks. These include the rights to perform the following classes of tasks:

- Manage database security for controlling the rights to perform actions on specific databases:
  - Manage access to a database and the right to start and stop a database
  - Manage indexes and constraints
  - Allow the creation of labels, relationship types or property names
  - Manage transactions

- Manage DBMS security for controlling the rights to perform actions on the entire system:
  - Manage multiple databases
  - Manage users and roles
  - Change configuration parameters
  - Manage sub-graph privileges
  - Manage procedure security

These rights are conferred using privileges that can be managed using GRANT, DENY and REVOKE commands.

Listing admin role privileges

SHOW ROLE admin PRIVILEGES AS COMMANDS

Table 497. Result
If the built-in admin role has been altered or dropped, and needs to be restored to its original state, see Operations Manual → Password and user recovery.

Recreating the admin role

To restore the role to its original capabilities two steps are needed. First, if not already done, execute DROP ROLE admin. Secondly, the following queries must be run in order to set up the privileges:

```
CREATE ROLE admin

GRANT ALL DBMS PRIVILEGES ON DBMS TO admin

GRANT TRANSACTION MANAGEMENT ON DATABASE * TO admin

GRANT START ON DATABASE * TO admin

GRANT STOP ON DATABASE * TO admin

GRANT MATCH ({*}) ON GRAPH * TO admin

GRANT WRITE ON GRAPH * TO admin

GRANT ALL ON DATABASE * TO admin
```

The resulting admin role now has the same privileges as the original built-in admin role.
Additional information about restoring the admin role can be found in the Operations Manual → Recover the admin role.

25.6. Read privileges

This section explains how to use Cypher to manage read privileges on graphs.

There are three separate read privileges:

- **TRAVERSE** - enables the specified entities to be found.
- **READ** - enables the specified properties on the found entities to be read.
- **MATCH** - combines both TRAVERSE and READ, enabling an entity to be found and its properties read.

25.6.1. The TRAVERSE privilege

Users can be granted the right to find nodes and relationships using the GRANT TRAVERSE privilege.

```
GRANT TRAVERSE
  ON { HOME GRAPH | GRAPH[S] { * | name[, ...] }}
  [ ELEMENT[S] { * | label-or-rel-type[, ...] }
    | NODE[S] { * | label[, ...] }
    | RELATIONSHIP[S] { * | rel-type[, ...] }
  ]
  TO role[, ...]
```

For example, we can enable the user jake, who has role 'regularUsers' to find all nodes with the label Post.

```
GRANT TRAVERSE ON GRAPH neo4j NODES Post TO regularUsers
```

The TRAVERSE privilege can also be denied.

```
DENY TRAVERSE
  ON { HOME GRAPH | GRAPH[S] { * | name[, ...] }}
  [ ELEMENT[S] { * | label-or-rel-type[, ...] }
    | NODE[S] { * | label[, ...] }
    | RELATIONSHIP[S] { * | rel-type[, ...] }
  ]
  TO role[, ...]
```

For example, we can disable the user jake, who has role 'regularUsers' from finding all nodes with the label Payments.

```
DENY TRAVERSE ON HOME GRAPH NODES Payments TO regularUsers
```

25.6.2. The READ privilege

Users can be granted the right to do property reads on nodes and relationships using the GRANT READ privilege. It is very important to note that users can only read properties on entities that they are enabled to
find in the first place.

For example, we can enable the user jake, who has role 'regularUsers' to read all properties on nodes with the label Post. The * implies that the ability to read all properties also extends to properties that might be added in the future.

```
GRANT READ { * } ON GRAPH neo4j NODES Post TO regularUsers
```

Granting property READ access does not imply that the entities with that property can be found. For example, if there is also a DENY TRAVERSE present on the same entity as a GRANT READ, the entity will not be found by a Cypher MATCH statement.

The READ privilege can also be denied.

```
DENY READ { * } ON GRAPH neo4j NODES Post TO regularUsers
```

Although we just granted the user 'jake' the right to read all properties, we may want to hide the secret property. The following example shows how to do that.

```
DENY READ { secret } ON GRAPH neo4j NODES Post TO regularUsers
```

25.6.3. The MATCH privilege

Users can be granted the right to find and do property reads on nodes and relationships using the GRANT MATCH privilege. This is semantically the same as having both TRAVERSE and READ privileges.

```
GRANT MATCH "{ * | property[ , . ] }"
ON (HOME | GRAPH) | (GRAPH[S] { * | name[ , . ] })
[ 
   ELEMENT[S] { * | label-or-rel-type[ , . ] }
| NODE[S] { * | label[ , . ] }
| RELATIONSHIP[S] { * | rel-type[ , . ] }
] TO role[ , . ]
```

For example, if you want to grant the ability to read the properties language and length for nodes with the
label Message, as well as the ability to find these nodes, to a role regularUsers you can use the following GRANT MATCH query.

```
GRANT MATCH { language, length } ON GRAPH neo4j NODES Message TO regularUsers
```

Like all other privileges, the MATCH privilege can also be denied.

```
DENY MATCH
{"{* | property[., ...]} "}"
ON (HOME | GRAPH | GRAPH[S] { * | name[., ...] })
[
  ELEMENT[S] { * | label-or-rel-type[, ...] }
  NODE[S] { * | label[, ...] }
  RELATIONSHIP[S] { * | rel-type[, ...] }
]
TO role[., ...]
```

Please note that the effect of denying a MATCH privilege depends on whether concrete property keys are specified or a *.

- If you specify concrete property keys then DENY MATCH will only deny reading those properties. Finding the elements to traverse would still be enabled. If you specify * instead then both traversal of the element and all property reads will be disabled. The following queries will show examples for this.

Denying to read the property ‘content’ on nodes with the label Message for the role regularUsers would look like the following query. Although not being able to read this specific property, nodes with that label can still be traversed (and, depending on other grants, other properties on it could still be read).

```
DENY MATCH { content } ON GRAPH neo4j NODES Message TO regularUsers
```

The following query exemplifies how it would look like if you want to deny both reading all properties and traversing nodes labeled with Account.

```
DENY MATCH { * } ON GRAPH neo4j NODES Account TO regularUsers
```

25.7. Write privileges [Enterprise edition](#)

This section explains how to use Cypher to manage write privileges on graphs.

Write privileges are defined for different parts of the graph:

- **CREATE** - allows creating nodes and relationships.
- **DELETE** - allows deleting nodes and relationships.
- **SET LABEL** - allows setting the specified node labels using the SET clause.
- **REMOVE LABEL** - allows removing the specified node labels using the REMOVE clause.
- **SET PROPERTY** - allows setting properties on nodes and relationships.

There are also compound privileges which combine the above specific privileges:
• **MERGE** - allows match, create and set property to permit the `MERGE` command.

• **WRITE** - allows all write operations on an entire graph.

• **ALL GRAPH PRIVILEGES** - allows all read and write operation on an entire graph.

### 25.7.1. The **CREATE** privilege

The **CREATE** privilege allows a user to create new node and relationship elements in a graph. See the Cypher `CREATE` clause.

```sql
GRANT CREATE ON {HOME GRAPH | GRAPH[S] { * | name[, ...] }}
[ ELEMENT[S] { * | label-or-rel-type[, ...] }
 | NODE[S] { * | label[, ...] }
 | RELATIONSHIP[S] { * | rel-type[, ...] }
] TO role[, ...]
```

For example, granting the ability to create elements on the graph `neo4j` to the role `regularUsers` would be achieved using:

```sql
GRANT CREATE ON GRAPH neo4j ELEMENTS * TO regularUsers
```

The **CREATE** privilege can also be denied.

```sql
DENY CREATE ON {HOME GRAPH | GRAPH[S] { * | name[, ...] }}
[ ELEMENT[S] { * | label-or-rel-type[, ...] }
 | NODE[S] { * | label[, ...] }
 | RELATIONSHIP[S] { * | rel-type[, ...] }
] TO role[, ...]
```

For example, denying the ability to create nodes with the label `foo` on all graphs to the role `regularUsers` would be achieved using:

```sql
DENY CREATE ON GRAPH * NODES foo TO regularUsers
```

If the user attempts to create nodes with a label that does not already exist in the database, then the user must also possess the **CREATE NEW LABEL** privilege. The same applies to new relationships - the **CREATE NEW RELATIONSHIP TYPE** privilege is required.

### 25.7.2. The **DELETE** privilege

The **DELETE** privilege allows a user to delete node and relationship elements in a graph. See the Cypher `DELETE` clause.
For example, granting the ability to delete elements on the graph `neo4j` to the role `regularUsers` would be achieved using:

```
GRANT DELETE ON GRAPH neo4j ELEMENTS * TO regularUsers
```

The `DELETE` privilege can also be denied.

```
DENY DELETE ON GRAPH * RELATIONSHIPS bar TO regularUsers
```

For example, denying the ability to delete relationships with the relationship type `bar` on all graphs to the role `regularUsers` would be achieved using:

```
DENY DELETE ON GRAPH * RELATIONSHIPS bar TO regularUsers
```

Users with `DELETE` privilege, but restricted `TRAVERSE` privileges, will not be able to do `DETACH DELETE` in all cases. See `Operations Manual → Fine-grained access control` for more info.

25.7.3. The `SET LABEL` privilege

The `SET LABEL` privilege allows you to set labels on a node using the `SET clause`.

```
GRANT SET LABEL { * | label[, ...] } ON (HOME GRAPH | GRAPH[S] { * | name[, ...] }) TO role[, ...]
```

For example, granting the ability to set any label on nodes of the graph `neo4j` to the role `regularUsers` would be achieved using:

```
GRANT SET LABEL * ON GRAPH neo4j TO regularUsers
```

Unlike many of the other read and write privileges, it is not possible to restrict the `SET LABEL` privilege to specific ELEMENTS, NODES or RELATIONSHIPS.

The `SET LABEL` privilege can also be denied.
For example, denying the ability to set the label `foo` on nodes of all graphs to the role `regularUsers` would be achieved using:

```
DENY SET LABEL foo ON GRAPH * TO regularUsers
```

If no instances of this label exist in the database, then the `CREATE NEW LABEL` privilege is also required.

### 25.7.4. The **REMOVE LABEL** privilege

The **REMOVE LABEL** privilege allows you to remove labels from a node using the `REMOVE` clause.

```
GRANT REMOVE LABEL { * | label[, ...] } ON (HOME GRAPH | GRAPH[S] { * | name[, ...] }) TO role[, ...]
```

For example, granting the ability to remove any label from nodes of the graph `neo4j` to the role `regularUsers` would be achieved using:

```
GRANT REMOVE LABEL * ON GRAPH neo4j TO regularUsers
```

Unlike many of the other read and write privileges, it is not possible to restrict the **REMOVE LABEL** privilege to specific ELEMENTS, NODES or RELATIONSHIPS.

The **REMOVE LABEL** privilege can also be denied.

```
DENY REMOVE LABEL { * | label[, ...] } ON (HOME GRAPH | GRAPH[S] { * | name[, ...] }) TO role[, ...]
```

For example, denying the ability to remove the label `foo` from nodes of all graphs to the role `regularUsers` would be achieved using:

```
DENY REMOVE LABEL foo ON GRAPH * TO regularUsers
```

### 25.7.5. The **SET PROPERTY** privilege

The **SET PROPERTY** privilege allows a user to set a property on a node or relationship element in a graph using the `SET` clause.
GRANT SET PROPERTY "{" { * | property[,...] } "}"
ON (HOME GRAPH | GRAPH[S] { * | name[,...] })
[
  ELEMENT[S] { * | label-or-rel-type[,...] }
  | NODE[S] { * | label[,...] }
  | RELATIONSHIP[S] { * | rel-type[,...] }
]
TO role[,...]

For example, granting the ability to set any property on all elements of the graph neo4j to the role regularUsers would be achieved using:

GRANT SET PROPERTY { * } ON HOME GRAPH ELEMENTS * TO regularUsers

The SET PROPERTY privilege can also be denied.

DENY SET PROPERTY "{" { * | property[,...] } "}"
ON (HOME GRAPH | GRAPH[S] { * | name[,...] })
[
  ELEMENT[S] { * | label-or-rel-type[,...] }
  | NODE[S] { * | label[,...] }
  | RELATIONSHIP[S] { * | rel-type[,...] }
]
TO role[,...]

For example, denying the ability to set the property foo on nodes with the label bar on all graphs to the role regularUsers would be achieved using:

DENY SET PROPERTY { foo } ON GRAPH * NODES bar TO regularUsers

If the users attempts to set a property with a property name that does not already exist in the database the user must also possess the CREATE NEW PROPERTY NAME privilege.

25.7.6. The MERGE privilege

The MERGE privilege is a compound privilege that combines TRAVERSE and READ (i.e. MATCH) with CREATE and SET PROPERTY. This is intended to permit use of the MERGE command but is applicable to all reads and writes that require these privileges.

GRANT MERGE "{" { * | property[,...] } "}"
ON (HOME GRAPH | GRAPH[S] { * | name[,...] })
[
  ELEMENT[S] { * | label-or-rel-type[,...] }
  | NODE[S] { * | label[,...] }
  | RELATIONSHIP[S] { * | rel-type[,...] }
]
TO role[,...]

For example, granting MERGE on all elements of the graph neo4j to the role regularUsers would be achieved using:

GRANT MERGE { * } ON GRAPH neo4j ELEMENTS * TO regularUsers
It is not possible to deny the `MERGE` privilege. If it is desirable to prevent a user from creating elements and setting properties, use `DENY CREATE` or `DENY SET PROPERTY`.

If the user attempts to create nodes with a label that does not already exist in the database, the user must also possess the `CREATE NEW LABEL` privilege. The same applies to new relationships and properties - the `CREATE NEW RELATIONSHIP TYPE` or `CREATE NEW PROPERTY NAME` privileges are required.

### 25.7.7. The WRITE privilege

The `WRITE` privilege allows the user to execute any write command on a graph.

```sql
GRANT WRITE
    ON (HOME GRAPH | GRAPH[S] { * | name[, ...] })
    TO role[, ...]
```

For example, granting the ability to write on the graph `neo4j` to the role `regularUsers` would be achieved using:

```
GRANT WRITE ON GRAPH neo4j TO regularUsers
```

Unlike the more specific write commands, it is not possible to restrict `WRITE` privileges to specific ELEMENTS, NODES or RELATIONSHIPS. If it is desirable to prevent a user from writing to a subset of database objects, a `GRANT WRITE` can be combined with more specific `DENY` commands to target these elements.

The `WRITE` privilege can also be denied.

```sql
DENY WRITE
    ON (HOME GRAPH | GRAPH[S] { * | name[, ...] })
    TO role[, ...]
```

For example, denying the ability to write on the graph `neo4j` to the role `regularUsers` would be achieved using:

```
DENY WRITE ON GRAPH neo4j TO regularUsers
```

Users with `WRITE` privilege but restricted `TRAVERSE` privileges will not be able to do `DETACH DELETE` in all cases. See [Operations Manual → Fine-grained access control](#) for more info.

### 25.7.8. The ALL GRAPH PRIVILEGES privilege

The `ALL GRAPH PRIVILEGES` privilege allows the user to execute any command on a graph.

```sql
GRANT ALL [ [ GRAPH ] PRIVILEGES ]
    ON (HOME GRAPH | GRAPH[S] { * | name[, ...] })
    TO role[, ...]
```
For example, granting all graph privileges on the graph neo4j to the role regularUsers would be achieved using:

```
GRANT ALL GRAPH PRIVILEGES ON GRAPH neo4j TO regularUsers
```

Unlike the more specific read and write commands, it is not possible to restrict ALL GRAPH PRIVILEGES privileges to specific ELEMENTS, NODES or RELATIONSHIPS. If it is desirable to prevent a user from reading or writing to a subset of database objects, a GRANT ALL GRAPH PRIVILEGES can be combined with more specific DENY commands to target these elements.

The ALL GRAPH PRIVILEGES privilege can also be denied.

```
DENY ALL [ [ GRAPH ] PRIVILEGES ]
   ON { HOME GRAPH | GRAPH[S] { * | name[, ...] } }
   TO role[,...]
```

For example, denying all graph privileges on the graph neo4j to the role regularUsers would be achieved using:

```
DENY ALL GRAPH PRIVILEGES ON GRAPH neo4j TO regularUsers
```

## 25.8. Database administration

This section explains how to use Cypher to manage Neo4j database administrative privileges.

The administrators can use the following Cypher commands to manage Neo4j database administrative rights. The components of the database privilege commands are:

- **the command:**
  - **GRANT** – gives privileges to roles.
  - **DENY** – denies privileges to roles.
  - **REVOKE** – removes granted or denied privilege from roles.

- **database-privilege**
  - **ACCESS** - allows access to a specific database.
  - **START** - allows the specified database to be started.
  - **STOP** - allows the specified database to be stopped.
  - **CREATE INDEX** - allows indexes to be created on the specified database.
  - **DROP INDEX** - allows indexes to be deleted on the specified database.
  - **SHOW INDEX** - allows indexes to be listed on the specified database.
  - **INDEX [MANAGEMENT]** - allows indexes to be created, deleted, and listed on the specified database.
**CREATE CONSTRAINT** - allows constraints to be created on the specified database.

**DROP CONSTRAINT** - allows constraints to be deleted on the specified database.

**SHOW CONSTRAINT** - allows constraints to be listed on the specified database.

**CONSTRAINT [MANAGEMENT]** - allows constraints to be created, deleted, and listed on the specified database.

**CREATE NEW [NODE] LABEL** - allows labels to be created so that future nodes can be assigned them.

**CREATE NEW [RELATIONSHIP] TYPE** - allows relationship types to be created, so that future relationships can be created with these types.

**CREATE NEW [PROPERTY] NAME** - allows property names to be created, so that nodes and relationships can have properties with these names assigned.

**NAME [MANAGEMENT]** - allows all of the name management capabilities: node labels, relationship types, and property names.

**ALL [[DATABASE] PRIVILEGES]** - allows access, index, constraint, and name management for the specified database.

**SHOW TRANSACTION** - allows listing transactions and queries for the specified users on the specified database.

**TERMINATE TRANSACTION** - allows ending transactions and queries for the specified users on the specified database.

**TRANSACTION [MANAGEMENT]** - allows listing and ending transactions and queries for the specified users on the specified database.

- **name**
  - The database to associate the privilege with.

  If you delete a database and create a new one with the same name, the new one will NOT have the privileges assigned to the deleted database.

- **role[,...]**
  - The role or roles to associate the privilege with, comma-separated.

Table 498. General database privilege command syntax
<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>GRANT database-privilege ON {HOME DATABASE</td>
<td>DATABASE[S] {*</td>
</tr>
<tr>
<td>DENY database-privilege ON {HOME DATABASE</td>
<td>DATABASE[S] {*</td>
</tr>
<tr>
<td>REVOKE GRANT database-privilege ON {HOME DATABASE</td>
<td>DATABASE[S] {*</td>
</tr>
<tr>
<td>REVOKE DENY database-privilege ON {HOME DATABASE</td>
<td>DATABASE[S] {*</td>
</tr>
<tr>
<td>REVOKE database-privilege ON {HOME DATABASE</td>
<td>DATABASE[S] {*</td>
</tr>
</tbody>
</table>

DENY does NOT erase a granted privilege; they both exist. Use REVOKE if you want to remove a privilege.

The hierarchy between the different database privileges is shown in the image below.

Figure 4. Database privileges hierarchy

Table 499. Database privilege command syntax

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>

<td>DATABASE[s] {*</td>
</tr>
<tr>
<td>GRANT ALL [[DATABASE] PRIVILEGES] ON {HOME DATABASE</td>
<td>DATABASE[s] {*</td>
</tr>
</tbody>
</table>
25.8.1. The database **ACCESS privilege**

The **ACCESS** privilege enables users to connect to a database. With **ACCESS** you can run calculations, for example, `RETURN 2*5 AS answer` or call functions `RETURN timestamp() AS time`.

**Granting ACCESS**

```
GRANT ACCESS
ON (HOME DATABASE | DATABASE[* | name[,...]])
TO role[, ...]
```

For example, granting the ability to access the database `neo4j` to the role `regularUsers` is done using the following query.

```
GRANT ACCESS ON DATABASE neo4j TO regularUsers
```

**Denying ACCESS**

```
DENY ACCESS
ON (HOME DATABASE | DATABASE[* | name[,...]])
TO role[, ...]
```

For example, denying the ability to access to the database `neo4j` to the role `regularUsers` is done using the following query.

```
DENY ACCESS ON DATABASE neo4j TO regularUsers
```
DENY ACCESS ON DATABASE neo4j TO regularUsers

The privileges granted can be seen using the SHOW PRIVILEGES command:

SHOW ROLE regularUsers PRIVILEGES AS COMMANDS

Table 500. Result

<table>
<thead>
<tr>
<th>command</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;DENY ACCESS ON DATABASE neo4j TO <code>regularUsers</code>&quot;</td>
</tr>
<tr>
<td>&quot;GRANT ACCESS ON DATABASE neo4j TO <code>regularUsers</code>&quot;</td>
</tr>
<tr>
<td></td>
</tr>
<tr>
<td>Rows: 2</td>
</tr>
</tbody>
</table>

25.8.2. The database START/STOP privileges

The START privilege can be used to enable the ability to start a database.

GRANT START
  ON (HOME DATABASE | DATABASE[S] [* | name[, ...]])
  TO role[, ...]

For example, granting the ability to start the database neo4j to the role regularUsers is done using the following query.

GRANT START ON DATABASE neo4j TO regularUsers

The START privilege can also be denied.

DENY START
  ON (HOME DATABASE | DATABASE[S] [* | name[, ...]])
  TO role[, ...]

For example, denying the ability to start to the database neo4j to the role regularUsers is done using the following query.

DENY START ON DATABASE system TO regularUsers

The STOP privilege can be used to enable the ability to stop a database.

GRANT STOP
  ON (HOME DATABASE | DATABASE[S] [* | name[, ...]])
  TO role[, ...]

For example, granting the ability to stop the database neo4j to the role regularUsers is done using the following query.
The **STOP** privilege can also be denied.

```sql
DENY STOP
    ON (HOME DATABASE | DATABASE[S] [* | name[, ...]])
    TO role[, ...]
```

For example, denying the ability to stop to the database `neo4j` to the role `regularUsers` is done using the following query.

```sql
DENY STOP ON DATABASE system TO regularUsers
```

The privileges granted can be seen using the `SHOW PRIVILEGES` command:

```sql
SHOW ROLE regularUsers PRIVILEGES AS COMMANDS
```

### Table 501. Result

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;DENY ACCESS ON DATABASE neo4j TO 'regularUsers'&quot;</td>
<td></td>
</tr>
<tr>
<td>&quot;DENY START ON DATABASE system TO 'regularUsers'&quot;</td>
<td></td>
</tr>
<tr>
<td>&quot;DENY STOP ON DATABASE system TO 'regularUsers'&quot;</td>
<td></td>
</tr>
<tr>
<td>&quot;GRANT ACCESS ON DATABASE neo4j TO 'regularUsers'&quot;</td>
<td></td>
</tr>
<tr>
<td>&quot;GRANT START ON DATABASE neo4j TO 'regularUsers'&quot;</td>
<td></td>
</tr>
<tr>
<td>&quot;GRANT STOP ON DATABASE neo4j TO 'regularUsers'&quot;</td>
<td></td>
</tr>
</tbody>
</table>

Rows: 6

Note that **START** and **STOP** privileges are not included in the **ALL DATABASE PRIVILEGES**.

### 25.8.3. The **INDEX MANAGEMENT** privileges

Indexes can be created, deleted, or listed with the `CREATE INDEX`, `DROP INDEX`, and `SHOW INDEXES` commands. The privilege to do this can be granted with `GRANT CREATE INDEX`, `GRANT DROP INDEX`, and `GRANT SHOW INDEX` commands. The privilege to do all three can be granted with `GRANT INDEX MANAGEMENT` command.

### Table 502. Index management command syntax

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
</table>
| `GRANT (CREATE | DROP | SHOW) INDEX[ES]
    ON (HOME DATABASE | DATABASE[S] [* | name[, ...]])
    TO role[, ...]`                                                      | Enable the specified roles to create, delete, or show indexes in the home database, specific database(s), or all databases. |
### 25.8.4. The CONSTRAINT MANAGEMENT privileges

Constraints can be created, deleted, or listed with the `CREATE CONSTRAINT`, `DROP CONSTRAINT` and `SHOW CONSTRAINTS` commands. The privilege to do this can be granted with `GRANT CREATE CONSTRAINT`, `GRANT DROP CONSTRAINT`, `GRANT SHOW CONSTRAINT` commands. The privilege to do all three can be granted with `GRANT CONSTRAINT MANAGEMENT` command.

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>GRANT (CREATE</td>
<td>DROP</td>
</tr>
<tr>
<td>GRANT CONSTRAINT[S] [MANAGEMENT] ON (HOME DATABASE</td>
<td>DATABASE[S] {*</td>
</tr>
</tbody>
</table>

For example, granting the ability to create constraints on the database `neo4j` to the role `regularUsers` is done using the following query.

```
GRANT CREATE CONSTRAINT ON DATABASE neo4j TO regularUsers
```

The `SHOW CONSTRAINTS` privilege only affects the `SHOW CONSTRAINTS` command, and not the older procedures for listing constraints, such as `db.constraints`.

### 25.8.5. The NAME MANAGEMENT privileges

The right to create new labels, relationship types, and property names is different from the right to create nodes, relationships, and properties. The latter is managed using database `WRITE` privileges, while the former is managed using specific `GRANT/DENY CREATE NEW` commands for each type.
Table 504. Label, relationship type and property name management command syntax

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>GRANT CREATE NEW [NODE] LABEL[S] ON (HOME DATABASE</td>
<td>DATABASE[S] {*</td>
</tr>
<tr>
<td>GRANT CREATE NEW [RELATIONSHIP] TYPE[S] ON (HOME DATABASE</td>
<td>DATABASE[S] {*</td>
</tr>
<tr>
<td>GRANT CREATE NEW [PROPERTY] NAME[S] ON (HOME DATABASE</td>
<td>DATABASE[S] {*</td>
</tr>
<tr>
<td>GRANT NAME [MANAGEMENT] ON (HOME DATABASE</td>
<td>DATABASE[S] {*</td>
</tr>
</tbody>
</table>

For example, granting the ability to create new properties on nodes or relationships in the database neo4j to the role regularUsers is done using the following query.

```sql
GRANT CREATE NEW PROPERTY NAME ON DATABASE neo4j TO regularUsers
```

### 25.8.6. Granting ALL DATABASE PRIVILEGES

The right to access a database, create and drop indexes and constraints and create new labels, relationship types or property names can be achieved with a single command:

```sql
GRANT ALL [[DATABASE] PRIVILEGES] ON (HOME DATABASE | DATABASE[S] {* | name[, ...]}) TO role[, ...]
```

Note that the privileges for starting and stopping all databases, and transaction management, are not included in the ALL DATABASE PRIVILEGES grant. These privileges are associated with administrators while other database privileges are of use to domain and application developers.

For example, granting the abilities above on the database neo4j to the role databaseAdminUsers is done using the following query.

```sql
GRANT ALL DATABASE PRIVILEGES ON DATABASE neo4j TO databaseAdminUsers
```

The privileges granted can be seen using the SHOW PRIVILEGES command:
SHOW ROLE databaseAdminUsers PRIVILEGES AS COMMANDS

Table 505. Result

<table>
<thead>
<tr>
<th>command</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;GRANT ALL DATABASE PRIVILEGES ON DATABASE neo4j TO <code>databaseAdminUsers</code>&quot;</td>
</tr>
<tr>
<td>Rows: 1</td>
</tr>
</tbody>
</table>

### 25.8.7. Granting TRANSACTION MANAGEMENT privileges

The right to run the procedures `dbms.listTransactions`, `dbms.listQueries`, `dbms.killQuery`, `dbms.killQueries`, `dbms.killTransaction` and `dbms.killTransactions` are managed through the **SHOW TRANSACTION** and **TERMINATE TRANSACTION** privileges.

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>GRANT SHOW TRANSACTION[S] [( (*</td>
<td>user[ , ...]) )] ON (HOME DATABASE</td>
</tr>
<tr>
<td>GRANT TERMINATE TRANSACTION[S] [( (*</td>
<td>user[ , ...]) )] ON (HOME DATABASE</td>
</tr>
<tr>
<td>GRANT TRANSACTION [MANAGEMENT] [( (*</td>
<td>user[ , ...]) )] ON (HOME DATABASE</td>
</tr>
</tbody>
</table>

Note that the **TRANSACTION MANAGEMENT** privileges are not included in the **ALL DATABASE PRIVILEGES**.

For example, granting the ability to list transactions for user jake in the database neo4j to the role regularUsers is done using the following query.

```
GRANT SHOW TRANSACTION (jake) ON DATABASE neo4j TO regularUsers
```

### 25.9. DBMS administration Enterprise edition

This section explains how to use Cypher to manage Neo4j DBMS administrative privileges.

All DBMS privileges are relevant system-wide. Like user management, they do not belong to one specific database or graph. For more details on the differences between graphs, databases and the DBMS, refer to
The **admin role** has a number of built-in privileges. These include:

- Create and drop databases.
- Change configuration parameters.
- Manage transactions.
- Manage users and roles.
- Manage sub-graph privileges.
- Manage procedure security.

The easiest way to enable a user to perform these tasks is to grant them the **admin role**. All of these privileges are also assignable using Cypher commands. See the sections on role management, user management, database management, privilege management, transaction management and procedure and user defined function security for details. It is possible to make a custom role with a subset of these privileges.
25.9.1. Using a custom role to manage DBMS privileges

If it is desired to have an administrator with a subset of privileges that includes all DBMS privileges, but not all database privileges, this can be achieved in multiple ways. One way is to copy the `admin` role and revoking or denying the unwanted privileges. A second option is to build a custom administrator from scratch by granting the wanted privileges instead.

As an example, let’s create an administrator that can only manage users and roles by using the latter option.

1. First we create the new role:

```
CREATE ROLE usermanager
```

2. Then we grant the privilege to manage users:

```
GRANT USER MANAGEMENT ON DBMS TO usermanager
```

3. And to manage roles:

```
GRANT ROLE MANAGEMENT ON DBMS TO usermanager
```

The resulting role has privileges that only allow user and role management:

```
SHOW ROLE usermanager PRIVILEGES AS COMMANDS
```

Lists all privileges for role `usermanager`:

Table 507. Result

<table>
<thead>
<tr>
<th>command</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;GRANT ROLE MANAGEMENT ON DBMS TO <code>usermanager</code>&quot;</td>
</tr>
<tr>
<td>&quot;GRANT USER MANAGEMENT ON DBMS TO <code>usermanager</code>&quot;</td>
</tr>
</tbody>
</table>

Rows: 2

However, this role doesn’t allow all DBMS capabilities. For example, the role is missing privilege management, creating and dropping databases as well as executing admin procedures. We can make a more powerful administrator by granting a different set of privileges. Let’s create an administrator that can perform almost all DBMS capabilities, excluding database management, but also with some limited database capabilities, such as managing transactions:

1. Again, we start by creating a new role:

```
CREATE ROLE customAdministrator
```
2. Then we grant the privilege for all DBMS capabilities:

```
GRANT ALL DBMS PRIVILEGES ON DBMS TO customAdministrator
```

3. And explicitly deny the privilege to manage databases:

```
DENY DATABASE MANAGEMENT ON DBMS TO customAdministrator
```

4. Thereafter we grant the transaction management privilege:

```
GRANT TRANSACTION MANAGEMENT (**) ON DATABASE * TO customAdministrator
```

The resulting role has privileges that allow all DBMS privileges except creating and dropping databases, as well as managing transactions:

```
SHOW ROLE customAdministrator PRIVILEGES AS COMMANDS
```

Lists all privileges for role `customAdministrator`:

Table 508. Result

<table>
<thead>
<tr>
<th>command</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;DENY DATABASE MANAGEMENT ON DBMS TO <code>customAdministrator</code>&quot;</td>
</tr>
<tr>
<td>&quot;GRANT ALL DBMS PRIVILEGES ON DBMS TO <code>customAdministrator</code>&quot;</td>
</tr>
<tr>
<td>&quot;GRANT TRANSACTION MANAGEMENT (**) ON DATABASE * TO <code>customAdministrator</code>&quot;</td>
</tr>
</tbody>
</table>

Rows: 3

25.9.2. The DBMS ROLE MANAGEMENT privileges

The DBMS privileges for role management are assignable using Cypher administrative commands. They can be granted, denied and revoked like other privileges.

Table 509. Role management privileges command syntax

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>GRANT CREATE ROLE ON DBMS TO role[,...]</td>
<td>Enable the specified roles to create new roles.</td>
</tr>
<tr>
<td>GRANT RENAME ROLE ON DBMS TO role[,...]</td>
<td>Enable the specified roles to change the name of roles.</td>
</tr>
<tr>
<td>Command</td>
<td>Description</td>
</tr>
<tr>
<td>---------</td>
<td>-------------</td>
</tr>
<tr>
<td>GRANT DROP ROLE ON DBMS TO role[,...]</td>
<td>Enable the specified roles to delete roles.</td>
</tr>
<tr>
<td>GRANT ASSIGN ROLE ON DBMS TO role[,...]</td>
<td>Enable the specified roles to assign roles to users.</td>
</tr>
<tr>
<td>GRANT REMOVE ROLE ON DBMS TO role[,...]</td>
<td>Enable the specified roles to remove roles from users.</td>
</tr>
<tr>
<td>GRANT SHOW ROLE ON DBMS TO role[,...]</td>
<td>Enable the specified roles to list roles.</td>
</tr>
<tr>
<td>GRANT ROLE MANAGEMENT ON DBMS TO role[,...]</td>
<td>Enable the specified roles to create, delete, assign, remove, and list roles.</td>
</tr>
</tbody>
</table>

The ability to add roles can be granted via the **CREATE ROLE** privilege. The following query shows an example of this:

```
GRANT CREATE ROLE ON DBMS TO roleAdder
```

The resulting role has privileges that only allow adding roles:

```
SHOW ROLE roleAdder PRIVILEGES AS COMMANDS
```

Lists all privileges for role `roleAdder`:

**Table 510. Result**

<table>
<thead>
<tr>
<th>command</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;GRANT CREATE ROLE ON DBMS TO 'roleAdder'&quot;</td>
</tr>
</tbody>
</table>

Rows: 1

The ability to rename roles can be granted via the **RENAME ROLE** privilege. The following query shows an example of this:

```
GRANT RENAME ROLE ON DBMS TO roleNameModifier
```
The resulting role has privileges that only allow renaming roles:

```
SHOW ROLE roleNameModifier PRIVILEGES AS COMMANDS
```

Lists all privileges for role `roleNameModifier`:

Table 511. Result

<table>
<thead>
<tr>
<th>command</th>
<th>Result</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;GRANT RENAME ROLE ON DBMS TO <code>roleNameModifier</code>&quot;</td>
<td></td>
</tr>
<tr>
<td>Rows: 1</td>
<td></td>
</tr>
</tbody>
</table>

The ability to delete roles can be granted via the `DROP ROLE` privilege. The following query shows an example of this:

```
GRANT DROP ROLE ON DBMS TO roleDropper
```

The resulting role has privileges that only allow deleting roles:

```
SHOW ROLE roleDropper PRIVILEGES AS COMMANDS
```

Lists all privileges for role `roleDropper`:

Table 512. Result

<table>
<thead>
<tr>
<th>command</th>
<th>Result</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;GRANT DROP ROLE ON DBMS TO <code>roleDropper</code>&quot;</td>
<td></td>
</tr>
<tr>
<td>Rows: 1</td>
<td></td>
</tr>
</tbody>
</table>

The ability to assign roles to users can be granted via the `ASSIGN ROLE` privilege. The following query shows an example of this:

```
GRANT ASSIGN ROLE ON DBMS TO roleAssigner
```

The resulting role has privileges that only allow assigning/granting roles:

```
SHOW ROLE roleAssigner PRIVILEGES AS COMMANDS
```

Lists all privileges for role `roleAssigner`:

Table 513. Result

<table>
<thead>
<tr>
<th>command</th>
<th>Result</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;GRANT ASSIGN ROLE ON DBMS TO <code>roleAssigner</code>&quot;</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
</tbody>
</table>
The ability to remove roles from users can be granted via the `REMOVE ROLE` privilege. The following query shows an example of this:

```
GRANT REMOVE ROLE ON DBMS TO roleRemover
```

The resulting role has privileges that only allow removing/revoking roles:

```
SHOW ROLE roleRemover PRIVILEGES AS COMMANDS
```

Lists all privileges for role `roleRemover`:

Table 514. Result

<table>
<thead>
<tr>
<th>command</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;GRANT REMOVE ROLE ON DBMS TO <code>roleRemover</code>&quot;</td>
</tr>
<tr>
<td>Rows: 1</td>
</tr>
</tbody>
</table>

The ability to show roles can be granted via the `SHOW ROLE` privilege. A user with this privilege is allowed to execute the `SHOW ROLES` and `SHOW POPULATED ROLES` administration commands. For the `SHOW ROLES WITH USERS` and `SHOW POPULATED ROLES WITH USERS` administration commands, both this privilege and the `SHOW USER` privilege are required. The following query shows an example of how to grant the `SHOW ROLE` privilege:

```
GRANT SHOW ROLE ON DBMS TO roleShower
```

The resulting role has privileges that only allow showing roles:

```
SHOW ROLE roleShower PRIVILEGES AS COMMANDS
```

Lists all privileges for role `roleShower`:

Table 515. Result

<table>
<thead>
<tr>
<th>command</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;GRANT SHOW ROLE ON DBMS TO <code>roleShower</code>&quot;</td>
</tr>
<tr>
<td>Rows: 1</td>
</tr>
</tbody>
</table>

The privileges to create, rename, delete, assign, remove, and list roles can be granted via the `ROLE MANAGEMENT` privilege. The following query shows an example of this:

```
GRANT ROLE MANAGEMENT ON DBMS TO roleManager
```
The resulting role has all privileges to manage roles:

```
SHOW ROLE roleManager PRIVILEGES AS COMMANDS
```

Lists all privileges for role `roleManager`:

Table 516. Result

<table>
<thead>
<tr>
<th>command</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;GRANT ROLE MANAGEMENT ON DBMS TO <code>roleManager</code>&quot;</td>
<td></td>
</tr>
<tr>
<td>Rows: 1</td>
<td></td>
</tr>
</tbody>
</table>

25.9.3. The DBMS USER MANAGEMENT privileges

The DBMS privileges for user management are assignable using Cypher administrative commands. They can be granted, denied and revoked like other privileges.

Table 517. User management privileges command syntax

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>GRANT CREATE USER ON DBMS TO role[, ...]</td>
<td>Enable the specified roles to create new users.</td>
</tr>
<tr>
<td>GRANT RENAME USER ON DBMS TO role[, ...]</td>
<td>Enable the specified roles to change the name of users.</td>
</tr>
<tr>
<td>GRANT ALTER USER ON DBMS TO role[, ...]</td>
<td>Enable the specified roles to modify users.</td>
</tr>
<tr>
<td>GRANT SET PASSWORD[S] ON DBMS TO role[, ...]</td>
<td>Enable the specified roles to modify users' passwords and whether those passwords must be changed upon first login.</td>
</tr>
<tr>
<td>GRANT SET USER HOME DATABASE ON DBMS TO role[, ...]</td>
<td>Enable the specified roles to modify users' home database.</td>
</tr>
<tr>
<td>GRANT SET USER STATUS ON DBMS TO role[, ...]</td>
<td>Enable the specified roles to modify the account status of users.</td>
</tr>
<tr>
<td>Command</td>
<td>Description</td>
</tr>
<tr>
<td>------------------------------------------------------------------------</td>
<td>-----------------------------------------------------------------</td>
</tr>
<tr>
<td>GRANT DROP USER ON DBMS TO role[, ...]</td>
<td>Enable the specified roles to delete users.</td>
</tr>
<tr>
<td>GRANT SHOW USER ON DBMS TO role[, ...]</td>
<td>Enable the specified roles to list users.</td>
</tr>
<tr>
<td>GRANT USER MANAGEMENT ON DBMS TO role[, ...]</td>
<td>Enable the specified roles to create, delete, modify, and list users.</td>
</tr>
</tbody>
</table>

The ability to add users can be granted via the `CREATE USER` privilege. The following query shows an example of this:

```sql
GRANT CREATE USER ON DBMS TO userAdder
```

The resulting role has privileges that only allow adding users:

```sql
SHOW ROLE userAdder PRIVILEGES AS COMMANDS
```

Lists all privileges for role `userAdder`:

**Table 518. Result**

<table>
<thead>
<tr>
<th>command</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;GRANT CREATE USER ON DBMS TO 'userAdder'&quot;</td>
</tr>
</tbody>
</table>

Rows: 1

The ability to rename users can be granted via the `RENAME USER` privilege. The following query shows an example of this:

```sql
GRANT RENAME USER ON DBMS TO userNameModifier
```

The resulting role has privileges that only allow renaming users:

```sql
SHOW ROLE userNameModifier PRIVILEGES AS COMMANDS
```

Lists all privileges for role `userNameModifier`:

**Table 519. Result**
The ability to modify users can be granted via the `ALTER USER` privilege. The following query shows an example of this:

```
GRANT ALTER USER ON DBMS TO userModifier
```

The resulting role has privileges that only allow modifying users:

```
SHOW ROLE userModifier PRIVILEGES AS COMMANDS
```

Lists all privileges for role `userModifier`:

Table 520. Result

<table>
<thead>
<tr>
<th>command</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;GRANT ALTER USER ON DBMS TO 'userModifier'&quot;</td>
</tr>
<tr>
<td>Rows: 1</td>
</tr>
</tbody>
</table>

A user that is granted `ALTER USER` is allowed to run the `ALTER USER` administration command with one or several of the `SET PASSWORD`, `SET PASSWORD CHANGE [NOT] REQUIRED` and `SET STATUS` parts:

```
ALTER USER jake SET PASSWORD 'secret' SET STATUS SUSPENDED
```

The ability to modify users' passwords and whether those passwords must be changed upon first login can be granted via the `SET PASSWORDS` privilege. The following query shows an example of this:

```
GRANT SET PASSWORDS ON DBMS TO passwordModifier
```

The resulting role has privileges that only allow modifying users' passwords and whether those passwords must be changed upon first login:

```
SHOW ROLE passwordModifier PRIVILEGES AS COMMANDS
```

Lists all privileges for role `passwordModifier`:

Table 521. Result

<table>
<thead>
<tr>
<th>command</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;GRANT SET PASSWORD ON DBMS TO 'passwordModifier'&quot;</td>
</tr>
<tr>
<td>Rows: 1</td>
</tr>
</tbody>
</table>
A user that is granted `SET PASSWORD` is allowed to run the `ALTER USER` administration command with one or both of the `SET PASSWORD` and `SET PASSWORD CHANGE [NOT] REQUIRED` parts:

```
ALTER USER jake SET PASSWORD 'abc123' CHANGE NOT REQUIRED
```

The ability to modify the account status of users can be granted via the `SET USER STATUS` privilege. The following query shows an example of this:

```
GRANT SET USER STATUS ON DBMS TO statusModifier
```

The resulting role has privileges that only allow modifying the account status of users:

```
SHOW ROLE statusModifier PRIVILEGES AS COMMANDS
```

Lists all privileges for role `statusModifier`:

Table 522. Result

<table>
<thead>
<tr>
<th>command</th>
</tr>
</thead>
</table>
| "GRANT SET USER STATUS ON DBMS TO `statusModifier`"
| Rows: 1 |

A user that is granted `SET USER STATUS` is allowed to run the `ALTER USER` administration command with only the `SET STATUS` part:

```
ALTER USER jake SET STATUS ACTIVE
```

The ability to modify the home database of users can be granted via the `SET USER HOME DATABASE` privilege. The following query shows an example of this:

```
GRANT SET USER HOME DATABASE ON DBMS TO statusModifier
```

The resulting role has privileges that only allow modifying the home database of users:

```
SHOW ROLE statusModifier PRIVILEGES AS COMMANDS
```

Lists all privileges for role `statusModifier`:

Table 523. Result

<table>
<thead>
<tr>
<th>command</th>
</tr>
</thead>
</table>
| "GRANT SET USER HOME DATABASE ON DBMS TO `statusModifier`"
| "GRANT SET USER STATUS ON DBMS TO `statusModifier`"
| Rows: 2 |
A user that is granted `SET USER HOME DATABASE` is allowed to run the `ALTER USER` administration command with only the `SET HOME DATABASE` or `REMOVE HOME DATABASE` part:

```
ALTER USER jake SET HOME DATABASE otherDb

ALTER USER jake REMOVE HOME DATABASE
```

Note that the combination of the `SET PASSWORDS`, `SET USER STATUS`, and the `SET USER HOME DATABASE` privilege actions is equivalent to the `ALTER USER` privilege action.

The ability to delete users can be granted via the `DROP USER` privilege. The following query shows an example of this:

```
GRANT DROP USER ON DBMS TO userDropper
```

The resulting role has privileges that only allow deleting users:

```
SHOW ROLE userDropper PRIVILEGES AS COMMANDS
```

Lists all privileges for role `userDropper`:

Table 524. Result

<table>
<thead>
<tr>
<th>command</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;GRANT DROP USER ON DBMS TO <code>userDropper</code>&quot;</td>
</tr>
<tr>
<td>Rows: 1</td>
</tr>
</tbody>
</table>

The ability to show users can be granted via the `SHOW USER` privilege. The following query shows an example of this:

```
GRANT SHOW USER ON DBMS TO userShower
```

The resulting role has privileges that only allow showing users:

```
SHOW ROLE userShower PRIVILEGES AS COMMANDS
```

Lists all privileges for role `userShower`:

Table 525. Result

<table>
<thead>
<tr>
<th>command</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;GRANT SHOW USER ON DBMS TO <code>userShower</code>&quot;</td>
</tr>
<tr>
<td>Rows: 1</td>
</tr>
</tbody>
</table>
The privileges to create, rename, modify, delete, and list users can be granted via the USER MANAGEMENT privilege. The following query shows an example of this:

```
GRANT USER MANAGEMENT ON DBMS TO userManager
```

The resulting role has all privileges to manage users:

```
SHOW ROLE userManager PRIVILEGES AS COMMANDS
```

25.9.4. The DBMS DATABASE MANAGEMENT privileges

The DBMS privileges for database management are assignable using Cypher administrative commands. They can be granted, denied and revoked like other privileges.

Table 526. Database management privileges command syntax

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>GRANT CREATE DATABASE ON DBMS TO role[, ...]</td>
<td>Enable the specified roles to create new databases.</td>
</tr>
<tr>
<td>GRANT DROP DATABASE ON DBMS TO role[, ...]</td>
<td>Enable the specified roles to delete databases.</td>
</tr>
<tr>
<td>GRANT DATABASE MANAGEMENT ON DBMS TO role[, ...]</td>
<td>Enable the specified roles to create and delete databases.</td>
</tr>
</tbody>
</table>

The ability to create databases can be granted via the CREATE DATABASE privilege. The following query shows an example of this:

```
GRANT CREATE DATABASE ON DBMS TO databaseAdder
```

The resulting role has privileges that only allow creating databases:

```
SHOW ROLE databaseAdder PRIVILEGES AS COMMANDS
```

Lists all privileges for role databaseAdder:

Table 527. Result

<table>
<thead>
<tr>
<th>command</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;GRANT CREATE DATABASE ON DBMS TO 'databaseAdder'&quot;</td>
</tr>
</tbody>
</table>
The ability to delete databases can be granted via the `DROP DATABASE` privilege. The following query shows an example of this:

```sql
GRANT DROP DATABASE ON DBMS TO databaseDropper
```

The resulting role has privileges that only allow deleting databases:

```sql
SHOW ROLE databaseDropper PRIVILEGES AS COMMANDS
```

Lists all privileges for role `databaseDropper`:

Table 528. Result

<table>
<thead>
<tr>
<th>command</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;GRANT DROP DATABASE ON DBMS TO <code>databaseDropper</code>&quot;</td>
</tr>
<tr>
<td>Rows: 1</td>
</tr>
</tbody>
</table>

The privileges to create and delete databases can be granted via the `DATABASE MANAGEMENT` privilege. The following query shows an example of this:

```sql
GRANT DATABASE MANAGEMENT ON DBMS TO databaseManager
```

The resulting role has all privileges to manage databases:

```sql
SHOW ROLE databaseManager PRIVILEGES AS COMMANDS
```

Lists all privileges for role `databaseManager`:

Table 529. Result

<table>
<thead>
<tr>
<th>command</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;GRANT DATABASE MANAGEMENT ON DBMS TO <code>databaseManager</code>&quot;</td>
</tr>
<tr>
<td>Rows: 1</td>
</tr>
</tbody>
</table>

### 25.9.5. The DBMS PRIVILEGE MANAGEMENT privileges

The DBMS privileges for privilege management are assignable using Cypher administrative commands. They can be granted, denied and revoked like other privileges.

Table 530. Privilege management privileges command syntax
<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>GRANT SHOW PRIVILEGE ON DBMS TO role[,] ...</td>
<td>Enable the specified roles to list privileges.</td>
</tr>
<tr>
<td>GRANT ASSIGN PRIVILEGE ON DBMS TO role[,] ...</td>
<td>Enable the specified roles to assign privileges using the GRANT and DENY commands.</td>
</tr>
<tr>
<td>GRANT REMOVE PRIVILEGE ON DBMS TO role[,] ...</td>
<td>Enable the specified roles to remove privileges using the REVOKE command.</td>
</tr>
<tr>
<td>GRANT PRIVILEGE MANAGEMENT ON DBMS TO role[,]</td>
<td>Enable the specified roles to list, assign, and remove privileges.</td>
</tr>
</tbody>
</table>

The ability to list privileges can be granted via the **SHOW PRIVILEGE** privilege. A user with this privilege is allowed to execute the **SHOW PRIVILEGES** and **SHOW ROLE roleName PRIVILEGES** administration commands. For the **SHOW USER username PRIVILEGES** administration command, both this privilege and the **SHOW USER** privilege are required. The following query shows an example of how to grant the **SHOW PRIVILEGE** privilege:

```
GRANT SHOW PRIVILEGE ON DBMS TO `privilegeShower`
```

The resulting role has privileges that only allow showing privileges:

```
SHOW ROLE privilegeShower PRIVILEGES AS COMMANDS
```

Lists all privileges for role `privilegeShower`:

<table>
<thead>
<tr>
<th>Table 531. Result</th>
</tr>
</thead>
<tbody>
<tr>
<td>command</td>
</tr>
<tr>
<td>&quot;GRANT SHOW PRIVILEGE ON DBMS TO 'privilegeShower'&quot;</td>
</tr>
<tr>
<td>Rows: 1</td>
</tr>
</tbody>
</table>

Note that no specific privileges are required for showing the current user’s privileges using either **SHOW USER username PRIVILEGES**, or **SHOW USER PRIVILEGES**.

Please note that if a non-native auth provider like LDAP is in use, **SHOW USER PRIVILEGES** will only work in a limited capacity; it is only possible for a user to show their own privileges. Other users' privileges cannot be listed when using a non-native auth provider.
The ability to assign privileges to roles can be granted via the `ASSIGN PRIVILEGE` privilege. A user with this privilege is allowed to execute GRANT and DENY administration commands. The following query shows an example of how to grant this privilege:

```sql
GRANT ASSIGN PRIVILEGE ON DBMS TO privilegeAssigner
```

The resulting role has privileges that only allow assigning privileges:

```sql
SHOW ROLE privilegeAssigner PRIVILEGES AS COMMANDS
```

Lists all privileges for role `privilegeAssigner`:

Table 532. Result

<table>
<thead>
<tr>
<th>command</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;GRANT ASSIGN PRIVILEGE ON DBMS TO <code>privilegeAssigner</code>&quot;</td>
</tr>
<tr>
<td>Rows: 1</td>
</tr>
</tbody>
</table>

The ability to remove privileges from roles can be granted via the `REMOVE PRIVILEGE` privilege. A user with this privilege is allowed to execute REVOKE administration commands. The following query shows an example of how to grant this privilege:

```sql
GRANT REMOVE PRIVILEGE ON DBMS TO privilegeRemover
```

The resulting role has privileges that only allow removing privileges:

```sql
SHOW ROLE privilegeRemover PRIVILEGES AS COMMANDS
```

Lists all privileges for role `privilegeRemover`:

Table 533. Result

<table>
<thead>
<tr>
<th>command</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;GRANT REMOVE PRIVILEGE ON DBMS TO <code>privilegeRemover</code>&quot;</td>
</tr>
<tr>
<td>Rows: 1</td>
</tr>
</tbody>
</table>

The privileges to list, assign, and remove privileges can be granted via the `PRIVILEGE MANAGEMENT` privilege. The following query shows an example of this:

```sql
GRANT PRIVILEGE MANAGEMENT ON DBMS TO privilegeManager
```

The resulting role has all privileges to manage privileges:

```sql
SHOW ROLE privilegeManager PRIVILEGES AS COMMANDS
```
Lists all privileges for role `privilegeManager`:

Table 534. Result

<table>
<thead>
<tr>
<th>command</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;GRANT PRIVILEGE MANAGEMENT ON DBMS TO 'privilegeManager'&quot;</td>
</tr>
<tr>
<td>Rows: 1</td>
</tr>
</tbody>
</table>

25.9.6. The DBMS **EXECUTE** privileges

The DBMS privileges for procedure and user defined function execution are assignable using Cypher administrative commands. They can be granted, denied and revoked like other privileges.

Table 535. Execute privileges command syntax

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>GRANT EXECUTE PROCEDURE[S] name-globbing[, ...] ON DBMS TO role[, ...]</td>
<td>Enable the specified roles to execute the given procedures.</td>
</tr>
<tr>
<td>GRANT EXECUTE BOOSTED PROCEDURE[S] name-globbing[, ...] ON DBMS TO role[, ...]</td>
<td>Enable the specified roles to execute the given procedures with elevated privileges.</td>
</tr>
<tr>
<td>GRANT EXECUTE ADMINISTRATOR PROCEDURES ON DBMS TO role[, ...]</td>
<td>Enable the specified roles to execute procedures annotated with <code>@Admin</code>. The procedures are executed with elevated privileges.</td>
</tr>
<tr>
<td>GRANT EXECUTE [USER [DEFINED]] FUNCTION[S] name-globbing[, ...] ON DBMS TO role[, ...]</td>
<td>Enable the specified roles to execute the given user defined functions.</td>
</tr>
<tr>
<td>GRANT EXECUTE BOOSTED [USER [DEFINED]] FUNCTION[S] name-globbing[, ...] ON DBMS TO role[, ...]</td>
<td>Enable the specified roles to execute the given user defined functions with elevated privileges.</td>
</tr>
</tbody>
</table>

The **EXECUTE BOOSTED** privileges replace the `dbms.security.procedures.default_allowed` and `dbms.security.procedures.roles` configuration parameters for procedures and user defined functions. The configuration parameters are still honoured as a set of temporary privileges. These cannot be revoked, but will be updated on each restart with the current configuration values.
The **EXECUTE PROCEDURE** privilege

The ability to execute a procedure can be granted via the **EXECUTE PROCEDURE** privilege. A user with this privilege is allowed to execute the procedures matched by the *name-globbing*. The following query shows an example of how to grant this privilege:

```
GRANT EXECUTE PROCEDURE db.schema.* ON DBMS TO procedureExecutor
```

Users with the role 'procedureExecutor' can then run any procedure in the `db.schema` namespace. The procedure is run using the user's own privileges. The resulting role has privileges that only allow executing procedures in the `db.schema` namespace:

```
SHOW ROLE procedureExecutor PRIVILEGES AS COMMANDS
```

Lists all privileges for role `procedureExecutor`:

Table 536. Result

<table>
<thead>
<tr>
<th>command</th>
</tr>
</thead>
</table>
| "GRANT EXECUTE PROCEDURE db.schema.* ON DBMS TO `procedureExecutor`"
|
| Rows: 1 |

If we want to allow executing all but a few procedures, we can grant **EXECUTE PROCEDURES * ** and deny the unwanted procedures. For example, the following queries allow for executing all procedures, except those starting with `dbms.killTransaction`:

```
GRANT EXECUTE PROCEDURE * ON DBMS TO deniedProcedureExecutor

DENY EXECUTE PROCEDURE dbms.killTransaction* ON DBMS TO deniedProcedureExecutor
```

The resulting role has privileges that only allow executing all procedures except those starting with `dbms.killTransaction`:

```
SHOW ROLE deniedProcedureExecutor PRIVILEGES AS COMMANDS
```

Lists all privileges for role `deniedProcedureExecutor`:

Table 537. Result

<table>
<thead>
<tr>
<th>command</th>
</tr>
</thead>
</table>
| "DENY EXECUTE PROCEDURE dbms.killTransaction* ON DBMS TO `deniedProcedureExecutor`"
| "GRANT EXECUTE PROCEDURE * ON DBMS TO `deniedProcedureExecutor`"
|
| Rows: 2 |
The `dbms.killTransaction` and `dbms.killTransactions` are blocked, as well as any other procedures starting with `dbms.killTransaction`.

The **EXECUTE BOOSTED PROCEDURE** privilege

The ability to execute a procedure with elevated privileges can be granted via the **EXECUTE BOOSTED PROCEDURE** privilege. A user with this privilege is allowed to execute the procedures matched by the name-globbing without the execution being restricted to their other privileges. There is no need to grant an individual **EXECUTE PROCEDURE** privilege for the procedures either, as granting the **EXECUTE BOOSTED PROCEDURE** includes an implicit **EXECUTE PROCEDURE** grant for them. A denied **EXECUTE PROCEDURE** still denies executing the procedure. The following query shows an example of how to grant this privilege:

```sql
GRANT EXECUTE BOOSTED PROCEDURE db.labels, db.relationshipTypes ON DBMS TO boostedProcedureExecutor
```

Users with the role `boostedProcedureExecutor` can then run `db.labels` and `db.relationshipTypes` with full privileges, seeing everything in the graph not just the labels and types that the user has **TRAVERSE** privilege on.

The resulting role has privileges that only allow executing procedures `db.labels` and `db.relationshipTypes`, but with elevated execution:

```sql
SHOW ROLE boostedProcedureExecutor PRIVILEGES AS COMMANDS
```

Lists all privileges for role `boostedProcedureExecutor`:

Table 538. Result

<table>
<thead>
<tr>
<th>command</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;GRANT EXECUTE BOOSTED PROCEDURE db.labels ON DBMS TO 'boostedProcedureExecutor'&quot;</td>
</tr>
<tr>
<td>&quot;GRANT EXECUTE BOOSTED PROCEDURE db.relationshipTypes ON DBMS TO 'boostedProcedureExecutor'&quot;</td>
</tr>
</tbody>
</table>

Rows: 2

Granting **EXECUTE BOOSTED PROCEDURE** on its own allows the procedure to be both executed (because of the implicit **EXECUTE PROCEDURE** grant) and given elevated privileges during the execution. A denied **EXECUTE BOOSTED PROCEDURE** on its own behaves slightly differently, and only denies the elevation and not the execution of the procedure. However, a role with only a granted **EXECUTE BOOSTED PROCEDURE** and a denied **EXECUTE BOOSTED PROCEDURE** will deny the execution as well. This is explained through the following examples:
Example 16. Grant EXECUTE PROCEDURE and deny EXECUTE BOOSTED PROCEDURE

| GRANT EXECUTE PROCEDURE * ON DBMS TO deniedBoostedProcedureExecutor1 |
| DENY EXECUTE BOOSTED PROCEDURE db.labels ON DBMS TO deniedBoostedProcedureExecutor1 |

The resulting role has privileges that allow executing all procedures using the user’s own privileges, as well as blocking db.labels from being elevated. The deny EXECUTE BOOSTED PROCEDURE does not block execution of db.labels.

SHOW ROLE deniedBoostedProcedureExecutor1 PRIVILEGES AS COMMANDS

Lists all privileges for role deniedBoostedProcedureExecutor1:

Table 539. Result

| command |
| "DENY EXECUTE BOOSTED PROCEDURE db.labels ON DBMS TO 'deniedBoostedProcedureExecutor1'" |
| "GRANT EXECUTE PROCEDURE * ON DBMS TO 'deniedBoostedProcedureExecutor1'" |
| Rows: 2 |

Example 17. Grant EXECUTE BOOSTED PROCEDURE and deny EXECUTE PROCEDURE

| GRANT EXECUTE BOOSTED PROCEDURE * ON DBMS TO deniedBoostedProcedureExecutor2 |
| DENY EXECUTE PROCEDURE db.labels ON DBMS TO deniedBoostedProcedureExecutor2 |

The resulting role has privileges that allow executing all procedures with elevated privileges except db.labels which is not allowed to execute at all:

SHOW ROLE deniedBoostedProcedureExecutor2 PRIVILEGES AS COMMANDS

Lists all privileges for role deniedBoostedProcedureExecutor2:

Table 540. Result

| command |
| "DENY EXECUTE PROCEDURE db.labels ON DBMS TO 'deniedBoostedProcedureExecutor2'" |
| "GRANT EXECUTE BOOSTED PROCEDURE * ON DBMS TO 'deniedBoostedProcedureExecutor2'" |
| Rows: 2 |
Example 18. Grant `EXECUTE BOOSTED PROCEDURE` and deny `EXECUTE BOOSTED PROCEDURE`:

```
GRANT EXECUTE BOOSTED PROCEDURE * ON DBMS TO deniedBoostedProcedureExecutor3

DENY EXECUTE BOOSTED PROCEDURE db.labels ON DBMS TO deniedBoostedProcedureExecutor3
```

The resulting role has privileges that allow executing all procedures with elevated privileges except `db.labels` which is not allowed to execute at all:

```
SHOW ROLE deniedBoostedProcedureExecutor3 PRIVILEGES AS COMMANDS
```

Lists all privileges for role `deniedBoostedProcedureExecutor3`:

Table 541. Result

<table>
<thead>
<tr>
<th>command</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;DENY EXECUTE BOOSTED PROCEDURE db.labels ON DBMS TO <code>deniedBoostedProcedureExecutor3</code>&quot;</td>
</tr>
<tr>
<td>&quot;GRANT EXECUTE BOOSTED PROCEDURE * ON DBMS TO <code>deniedBoostedProcedureExecutor3</code>&quot;</td>
</tr>
</tbody>
</table>

Rows: 2

Example 19. Grant `EXECUTE PROCEDURE` and `EXECUTE BOOSTED PROCEDURE` and deny `EXECUTE BOOSTED PROCEDURE`:

```
GRANT EXECUTE PROCEDURE db.labels ON DBMS TO deniedBoostedProcedureExecutor4

GRANT EXECUTE BOOSTED PROCEDURE * ON DBMS TO deniedBoostedProcedureExecutor4

DENY EXECUTE BOOSTED PROCEDURE db.labels ON DBMS TO deniedBoostedProcedureExecutor4
```

The resulting role has privileges that allow executing all procedures with elevated privileges except `db.labels` which is only allowed to execute using the user's own privileges:

```
SHOW ROLE deniedBoostedProcedureExecutor4 PRIVILEGES AS COMMANDS
```

Table 542. Result

<table>
<thead>
<tr>
<th>command</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;DENY EXECUTE BOOSTED PROCEDURE db.labels ON DBMS TO <code>deniedBoostedProcedureExecutor4</code>&quot;</td>
</tr>
<tr>
<td>&quot;GRANT EXECUTE BOOSTED PROCEDURE * ON DBMS TO <code>deniedBoostedProcedureExecutor4</code>&quot;</td>
</tr>
<tr>
<td>&quot;GRANT EXECUTE PROCEDURE db.labels ON DBMS TO <code>deniedBoostedProcedureExecutor4</code>&quot;</td>
</tr>
</tbody>
</table>

Rows: 3
Example 20. How would the privileges from Examples 1 to 4 affect the output of a procedure?

Let’s assume there exists a procedure called `myProc`.

This procedure gives the result `A` and `B` for a user with `EXECUTE PROCEDURE` privilege and `A`, `B` and `C` for a user with `EXECUTE BOOSTED PROCEDURE` privilege.

Now, let’s adapt the privileges in examples 1 to 4 to apply to this procedure and show what is returned. With the privileges from example 1, granted `EXECUTE PROCEDURE *` and denied `EXECUTE BOOSTED PROCEDURE myProc`, the `myProc` procedure returns the result `A` and `B`.

With the privileges from example 2, granted `EXECUTE BOOSTED PROCEDURE *` and denied `EXECUTE PROCEDURE myProc`, execution of the `myProc` procedure is not allowed.

With the privileges from example 3, granted `EXECUTE BOOSTED PROCEDURE *` and denied `EXECUTE BOOSTED PROCEDURE myProc`, execution of the `myProc` procedure is not allowed.

With the privileges from example 4, granted `EXECUTE PROCEDURE myProc` and `EXECUTE BOOSTED PROCEDURE *` and denied `EXECUTE BOOSTED PROCEDURE myProc`, the `myProc` procedure returns the result `A` and `B`.

For comparison, when only granted `EXECUTE BOOSTED PROCEDURE myProc`, the `myProc` procedure returns the result `A`, `B` and `C`, without needing to be granted the `EXECUTE PROCEDURE myProc` privilege.

The `EXECUTE ADMIN PROCEDURE` privilege

The ability to execute admin procedures (annotated with @Admin) can be granted via the `EXECUTE ADMIN PROCEDURES` privilege. This privilege is equivalent with granting the `EXECUTE BOOSTED PROCEDURE` privilege on each of the admin procedures. Any new admin procedures that gets added are automatically included in this privilege. The following query shows an example of how to grant this privilege:

```sql
GRANT EXECUTE ADMIN PROCEDURES ON DBMS TO adminProcedureExecutor
```

Users with the role `adminProcedureExecutor` can then run any admin procedure with elevated privileges.

The resulting role has privileges that allow executing all admin procedures:

```sql
SHOW ROLE adminProcedureExecutor PRIVILEGES AS COMMANDS
```

Lists all privileges for role `adminProcedureExecutor`:

Table 543. Result

<table>
<thead>
<tr>
<th>command</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;GRANT EXECUTE ADMIN PROCEDURES ON DBMS TO <code>adminProcedureExecutor</code>&quot;</td>
</tr>
</tbody>
</table>

Rows: 1
To compare this with the `EXECUTE PROCEDURE` and `EXECUTE BOOSTED PROCEDURE` privileges, let's revisit the `myProc` procedure. This time as an admin procedure, which gives the result `A`, `B` and `C` when allowed to execute.

Let's start with a user only granted the `EXECUTE PROCEDURE myProc` privilege, execution of the `myProc` procedure is not allowed.

However, for a user granted `EXECUTE BOOSTED PROCEDURE myProc` or `EXECUTE ADMIN PROCEDURES`, the `myProc` procedure returns the result `A`, `B` and `C`.

Any denied execute privilege results in the procedure not being allowed to execute. It does not matter whether `EXECUTE PROCEDURE`, `EXECUTE BOOSTED PROCEDURE` or `EXECUTE ADMIN PROCEDURES` is denied.

The `EXECUTE USER DEFINED FUNCTION` privilege

The ability to execute a user defined function (UDF) can be granted via the `EXECUTE USER DEFINED FUNCTION` privilege. A user with this privilege is allowed to execute the UDFs matched by the name-globbing.

The `EXECUTE USER DEFINED FUNCTION` privilege does not apply to built-in functions, which are always executable.

Example 21. Execute user defined function

The following query shows an example of how to grant this privilege:

```
GRANT EXECUTE USER DEFINED FUNCTION apoc.coll.* ON DBMS TO functionExecutor
```

Or in short form:

```
GRANT EXECUTE FUNCTION apoc.coll.* ON DBMS TO functionExecutor
```

Users with the role `functionExecutor` can then run any UDF in the `apoc.coll` namespace. The function is run using the user's own privileges.

The resulting role has privileges that only allow executing UDFs in the `apoc.coll` namespace:

```
SHOW ROLE functionExecutor PRIVILEGES AS COMMANDS
```

Lists all privileges for role `functionExecutor`:

<table>
<thead>
<tr>
<th>Table 544. Result</th>
</tr>
</thead>
<tbody>
<tr>
<td>command</td>
</tr>
<tr>
<td>&quot;GRANT EXECUTE FUNCTION apoc.coll.* ON DBMS TO 'functionExecutor'&quot;</td>
</tr>
<tr>
<td>Rows: 1</td>
</tr>
</tbody>
</table>
If you want to allow executing all but a few UDFs, you can grant \texttt{EXECUTE USER DEFINED FUNCTIONS \ast} and deny the unwanted functions.

Example 22. Execute user defined functions

The following queries allow for executing all UDFs except those starting with \texttt{apoc.any.prop}:

\begin{verbatim}
GRANT EXECUTE USER DEFINED FUNCTIONS \ast ON DBMS TO deniedFunctionExecutor

DENY EXECUTE USER DEFINED FUNCTION apoc.any.prop\ast ON DBMS TO deniedFunctionExecutor
\end{verbatim}

Or in short form:

\begin{verbatim}
GRANT EXECUTE FUNCTIONS \ast ON DBMS TO deniedFunctionExecutor

DENY EXECUTE FUNCTION apoc.any.prop\ast ON DBMS TO deniedFunctionExecutor
\end{verbatim}

The resulting role has privileges that only allow executing all procedures except those starting with \texttt{apoc.any.prop}:

\begin{verbatim}
SHOW ROLE deniedFunctionExecutor PRIVILEGES AS COMMANDS
\end{verbatim}

Lists all privileges for role \texttt{deniedFunctionExecutor}:

<table>
<thead>
<tr>
<th>Table 545. Result</th>
</tr>
</thead>
<tbody>
<tr>
<td>command</td>
</tr>
<tr>
<td></td>
</tr>
<tr>
<td>&quot;DENY EXECUTE FUNCTION apoc.any.prop\ast ON DBMS TO <code>deniedFunctionExecutor</code>&quot;</td>
</tr>
<tr>
<td>&quot;GRANT EXECUTE FUNCTION \ast ON DBMS TO <code>deniedFunctionExecutor</code>&quot;</td>
</tr>
<tr>
<td>Rows: 2</td>
</tr>
</tbody>
</table>

The \texttt{apoc.any.property} and \texttt{apoc.any.properties} is blocked, as well as any other procedures starting with \texttt{apoc.any.prop}.

The \textbf{EXECUTE BOOSTED USER DEFINED FUNCTION} privilege

The ability to execute a user defined function (UDF) with elevated privileges can be granted via the \texttt{EXECUTE BOOSTED USER DEFINED FUNCTION} privilege. A user with this privilege is allowed to execute the UDFs matched by the \texttt{name-globbing} without the execution being restricted to their other privileges. There is no need to grant an individual \texttt{EXECUTE USER DEFINED FUNCTION} privilege for the functions either, as granting the \texttt{EXECUTE BOOSTED USER DEFINED FUNCTION} includes an implicit \texttt{EXECUTE USER DEFINED FUNCTION} grant for them. A denied \texttt{EXECUTE USER DEFINED FUNCTION} still denies executing the function.
The `EXECUTE BOOSTED USER DEFINED FUNCTION` privilege does not apply to built-in functions, as they have no concept of elevated privileges.

Granting `EXECUTE BOOSTED USER DEFINED FUNCTION` on its own allows the UDF to be both executed (because of the implicit `EXECUTE USER DEFINED FUNCTION` grant) and given elevated privileges during the execution. A denied `EXECUTE BOOSTED USER DEFINED FUNCTION` on its own behaves slightly differently, and only denies the elevation and not the execution of the UDF. However, a role with only a granted `EXECUTE BOOSTED USER DEFINED FUNCTION` and a denied `EXECUTE BOOSTED USER DEFINED FUNCTION` denies the execution as well. This is the same behavior as for the `EXECUTE BOOSTED PROCEDURE` privilege.

Example 23. Execute boosted user defined function

The following query shows an example of how to grant the `EXECUTE BOOSTED USER DEFINED FUNCTION` privilege:

```
GRANT EXECUTE BOOSTED USER DEFINED FUNCTION apoc.any.properties ON DBMS TO boostedFunctionExecutor
```

Or in short form:

```
GRANT EXECUTE BOOSTED FUNCTION apoc.any.properties ON DBMS TO boostedFunctionExecutor
```

Users with the role `boostedFunctionExecutor` can then run `apoc.any.properties` with full privileges, seeing every property on the node/relationship not just the properties that the user has `READ` privilege on.

The resulting role has privileges that only allow executing the UDF `apoc.any.properties`, but with elevated execution:

```
SHOW ROLE boostedFunctionExecutor PRIVILEGES AS COMMANDS
```

Lists all privileges for role `boostedFunctionExecutor`:

Table 546. Result

<table>
<thead>
<tr>
<th>command</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;GRANT EXECUTE BOOSTED FUNCTION apoc.any.properties ON DBMS TO 'boostedFunctionExecutor'&quot;</td>
</tr>
</tbody>
</table>

Rows: 1

Procedure and user-defined function name-globbing

The name-globbing for procedure and user defined function names is a simplified version of globbing for filename expansions, only allowing two wildcard characters; * and ?. They are used for multiple and single character matches, where * means 0 or more characters and ? matches exactly one character.
The name-globbing is subject to the standard Cypher restrictions on valid identifiers, with the exception that it may include dots, stars, and question marks without the need for escaping using backticks. Each part of the name-globbing separated by dots may be individually escaped, for example, `mine.` procedureWith%` but not mine.procedure`With%`. Also good to keep in mind is that the wildcard characters behave as wildcards even when escaped. As an example, using `*` is equivalent to using *, and thus allows executing all functions or procedures and not only the procedure or function named `*`.

The examples below only use procedures but the same rules apply to user defined function names. For the examples below, assume we have the following procedures:

- mine.public.exampleProcedure
- mine.public.exampleProcedure1
- mine.public.exampleProcedure2
- mine.public.with#Special§Characters
- mine.private.exampleProcedure
- mine.private.exampleProcedure1
- mine.private.exampleProcedure2
- mine.private.with#Special§Characters
- your.exampleProcedure

```
GRANT EXECUTE PROCEDURE * ON DBMS TO globbing!
```

Users with the role `globbing1` can then run procedures all the procedures.

```
GRANT EXECUTE PROCEDURE mine.*.exampleProcedure ON DBMS TO globbing2
```

Users with the role `globbing2` can then run procedures `mine.public.exampleProcedure` and `mine.private.exampleProcedure`, but none of the others.

```
GRANT EXECUTE PROCEDURE mine.*.exampleProcedure2 ON DBMS TO globbing3
```

Users with the role `globbing3` can then run procedures `mine.public.exampleProcedure1`, `mine.private.exampleProcedure1` and `mine.private.exampleProcedure2`, but none of the others.

```
GRANT EXECUTE PROCEDURE * .exampleProcedure ON DBMS TO globbing4
```

Users with the role `globbing4` can then run procedures `your.exampleProcedure`, `mine.public.exampleProcedure` and `mine.private.exampleProcedure`, but none of the others.

```
GRANT EXECUTE PROCEDURE mine.public.exampleProcedure* ON DBMS TO globbing5
```
Users with the role `globbing5` can then run procedures `mine.public.exampleProcedure`, `mine.public.exampleProcedure1` and `mine.public.exampleProcedure42`, but none of the others.

```
GRANT EXECUTE PROCEDURE 'mine.public.with#*§Characters', mine.private.'with#Spec???§Characters' ON DBMS TO globbing6
```

Users with the role `globbing6` can then run procedures `mine.public.with#Special§Characters` and `mine.private.with#Special§Characters`, but none of the others.

- The name-globbing may be fully or partially escaped, and both the * and ? are interpreted as wildcards either way.

### 25.9.7. Granting ALL DBMS PRIVILEGES

The right to perform the following privileges can be achieved with a single command:

- create roles
- drop roles
- assign roles
- remove roles
- show roles
- create users
- alter users
- drop users
- show users
- create databases
- drop databases
- show privileges
- assign privileges
- remove privileges
- execute all procedures with elevated privileges
- execute all user defined functions with elevated privileges

```
GRANT ALL [DBMS] PRIVILEGES
   ON DBMS
   TO role[, ...]
```

For example, granting the abilities above to the role `dbmsManager` is done using the following query.

```
GRANT ALL DBMS PRIVILEGES ON DBMS TO dbmsManager
```

The privileges granted can be seen using the `SHOW PRIVILEGES` command:
SHOW ROLE dbmsManager PRIVILEGES AS COMMANDS

Table 547. Result

<table>
<thead>
<tr>
<th>command</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;GRANT ALL DBMS PRIVILEGES ON DBMS TO <code>dbmsManager</code>&quot;</td>
</tr>
<tr>
<td>Rows: 1</td>
</tr>
</tbody>
</table>

25.10. Limitations

This section explains known limitations and implications of Neo4j's role-based access control security.

25.10.1. Security and Indexes

As described in Indexes for search performance, Neo4j 4.3 supports the creation and use of indexes to improve the performance of Cypher queries. The Neo4j security model will impact the results of queries (regardless if the indexes are used). When using non full-text Neo4j indexes, a Cypher query will always return the same results it would have if no index existed. This means that if the security model causes fewer results to be returned due to restricted read access in Graph and sub-graph access control, the index will also return the same fewer results.

However, this rule is not fully obeyed by Indexes for full-text search. These specific indexes are backed by Lucene internally. It is therefore not possible to know for certain whether a security violation occurred for each specific entry returned from the index. As a result, Neo4j will return zero results from full-text indexes if it is determined that any result might violate the security privileges active for that query.

Since full-text indexes are not automatically used by Cypher, this does not lead to the case where the same Cypher query would return different results simply because such an index got created. Users need to explicitly call procedures to use these indexes. The problem is only that if this behavior is not understood by the user, they might expect the full text index to return the same results that a different, but semantically similar, Cypher query does.

Example with denied properties

Consider the following example. The database has nodes with labels :User and :Person, and these have properties name and surname. We have indexes on both properties:

```cypher
CREATE INDEX singleProp FOR (n:User) ON (n.name);
CREATE INDEX composite FOR (n:User) ON (n.name, n.surname);
CREATE FULLTEXT INDEX userNames FOR (n:User|Person) ON EACH [n.name, n.surname];
```

Full-text indexes support multiple labels. See Indexes for full-text search for more details on creating and using full-text indexes.
After creating these indexes, it would appear that the latter two indexes accomplish the same thing. However, this is not completely accurate. The composite and fulltext indexes behave in different ways and are focused on different use cases. A key difference is that full-text indexes are backed by Lucene, and will use the Lucene syntax for querying the index.

This has consequences for users restricted on the labels or properties involved in the indexes. Ideally, if the labels and properties in the index are denied, we can correctly return zero results from both native indexes and full-text indexes. However, there are borderline cases where this is not as simple.

Imagine the following nodes were added to the database:

```
CREATE (:User {name:'Sandy'});
CREATE (:User {name:'Mark', surname:'Andy'});
CREATE (:User {name:'Andy', surname:'Anderson'});
CREATE (:User:Person {name:'Mandy', surname:'Smith'});
CREATE (:User:Person {name:'Joe', surname:'Andy'});
```

Consider denying the label :Person.

```
DENY TRAVERSE Person ON GRAPH * TO users;
```

If the user runs a query that uses the native single property index on name:

```
MATCH (n:User) WHERE n.name CONTAINS 'ndy' RETURN n.name;
```

This query performs several checks:

- do a scan on the index to create a stream of results of nodes with the name property, which leads to five results
- filter the results to include only nodes where n.name CONTAINS 'ndy', filtering out Mark and Joe so we have three results
- filter the results to exclude nodes that also have the denied label :Person, filtering out Mandy so we have two results

For the above dataset, we can see we will get two results and that only one of these has the surname property.

To use the native composite index on name and surname, the query needs to include a predicate on the surname property as well:

```
MATCH (n:User) WHERE n.name CONTAINS 'ndy' AND n.surname IS NOT NULL RETURN n.name;
```

This query performs several checks, almost identical to the single property index query:

- do a scan on the index to create a stream of results of nodes with the name and surname property, which leads to four results
- filter the results to include only nodes where n.name CONTAINS 'ndy', filtering out Mark and Joe so we have two results
• filter the results to exclude nodes that also have the denied label :Person, filtering out Mandy so we only have one result

For the above dataset, we can see we will get one result.

What if we query this with the full-text index:

```sql
call db.index.fulltext.querynodes("userNames", "ndy") yield node, score
return node.name
```

The problem now is that we do not know if the results provided by the index were because of a match to the name or the surname property. The steps taken by the query engine would be:

• run a Lucene query on the full-text index to produce results containing ndy in either property, leading to five results.
• filter the results to exclude nodes that also have the label :Person, filtering out Mandy and Joe so we have three results.

This difference in results is due to the OR relationship between the two properties in the index creation.

Denying properties

Now consider denying access on properties, like the surname property:

```sql
deny read {surname} on graph * to users;
```

Now we run the same queries again:

```sql
match (n:user) where n.name contains 'ndy' return n.name;
```

This query operates exactly as before, returning the same two results, because nothing in this query relates to the denied property.

However, for the query targeting the composite index, things have changed.

```sql
match (n:user) where n.name contains 'ndy' and n.surname is not null return n.name;
```

Since the surname property is denied, it will appear to always be null and the composite index empty. Therefore, the query returns no result.

Now consider the full-text index query:

```sql
call db.index.fulltext.querynodes("userNames", "ndy") yield node, score
return node.name
```

The problem remains, we do not know if the results provided by the index were because of a match on the name or the surname property. Results from the surname now need to be excluded by the security rules, because they require that the user cannot see any surname properties. However, the security model is not
able to introspect the Lucene query to know what it will actually do, whether it works only on the allowed name property, or also on the disallowed surname property. We know that the earlier query returned a match for Joe Andy which should now be filtered out. So, in order to never return results the user should not be able to see, we have to block all results. The steps taken by the query engine would be:

- Determine if the full-text index includes denied properties
- If yes, return an empty results stream, otherwise process as before

The query will therefore return zero results in this case, rather than simply returning the results Andy and Sandy which might be expected.

25.10.2. Security and labels

Traversing the graph with multi-labeled nodes

The general influence of access control privileges on graph traversal is described in detail in Graph and sub-graph access control. The following section will only focus on nodes because of their ability to have multiple labels. Relationships can only ever have one type and thus they do not exhibit the behavior this section aims to clarify. While this section will not mention relationships further, the general function of the traverse privilege also applies to them.

For any node that is traversable, due to GRANT TRAVERSE or GRANT MATCH, the user can get information about the labels attached to the node by calling the built-in labels() function. In the case of nodes with multiple labels, this can seemingly result in labels being returned to which the user wasn’t directly granted access to.

To give an illustrative example, imagine a graph with three nodes: one labeled :A, one labeled :B and one with :A :B. We also have a user with a role custom as defined by:

```
GRANT TRAVERSE ON GRAPH * NODES A TO custom;
```

If that user were to execute

```
MATCH (n:A) RETURN n, labels(n);
```

they would be returned two nodes: the node that was labeled with :A and the node with labels :A :B.

In contrast, executing

```
MATCH (n:B) RETURN n, labels(n);
```

will return only the one node that has both labels: :A :B. Even though :B was not allowed access for traversal, there is one node with that label accessible in the data because of the allowlisted label :A that is attached to the same node.

If a user is denied traverse on a label they will never get results from any node that has this label attached to it. Thus, the label name will never show up for them. For our example this can be done by executing:
The query

```cypher
MATCH (n:A) RETURN n, labels(n);
```

will now return the node only labeled with :A, while the query

```cypher
MATCH (n:B) RETURN n, labels(n);
```

will now return no nodes.

The `db.labels()` procedure

In contrast to the normal graph traversal described in the previous section, the built-in `db.labels()` procedure is not processing the data graph itself but the security rules defined on the system graph. That means:

- if a label is explicitly whitelisted (granted), it will be returned by this procedure.
- if a label is denied or isn’t explicitly allowed it will not be returned by this procedure.

To reuse the example of the previous section: imagine a graph with three nodes: one labeled :A, one labeled :B and one with :A :B. We also have a user with a role `custom` as defined by:

```cypher
GRANT TRAVERSE ON GRAPH * NODES Person TO custom;
```

This means that only label :A is explicitly allowlisted. Thus, executing

```cypher
CALL db.labels();
```

will only return label :A because that is the only label for which traversal was granted.

25.10.3. Security and count store operations

The rules of a security model may impact some of the database operations. This comes down to necessary additional security checks that incur additional data accesses. Especially in regards to count store operations, as they are usually very fast lookups, the difference might be noticeable.

Let’s look at the following security rules that set up a `restricted` and a `free` role as an example:

```cypher
GRANT TRAVERSE ON GRAPH * NODES Person TO restricted;
DENY TRAVERSE ON GRAPH * NODES Customer TO restricted;
GRANT TRAVERSE ON GRAPH * ELEMENTS * TO free;
```

Now, let’s look at what the database needs to do in order to execute the following query:
MATCH (n:Person) RETURN count(n);

For both roles the execution plan will look like this:

```
<table>
<thead>
<tr>
<th>Operator</th>
</tr>
</thead>
<tbody>
<tr>
<td>+ProduceResults</td>
</tr>
<tr>
<td></td>
</tr>
<tr>
<td>+NodeCountFromCountStore</td>
</tr>
<tr>
<td>--------------------------</td>
</tr>
</tbody>
</table>
```

Internally however, very different operations need to be executed. The following table illustrates the difference.

<table>
<thead>
<tr>
<th>User with free role</th>
<th>User with restricted role</th>
</tr>
</thead>
<tbody>
<tr>
<td>The database can access the count store and retrieve the total number of nodes with the label :Person.</td>
<td>The database cannot just access the count store because it must make sure that only traversable nodes with the desired label :Person are counted. Due to this, each node with the :Person label needs to be accessed and examined to make sure that it does not also have a denylisted label, such as :Customer.</td>
</tr>
<tr>
<td>This is a very quick operation.</td>
<td>Due to the additional data accesses that the security checks need to do, this operation will be slower compared to executing the query as an unrestricted user.</td>
</tr>
</tbody>
</table>

Chapter 26. Query tuning

This section describes query tuning for the Cypher query language.

Neo4j aims to execute queries as fast as possible.

However, when optimizing for maximum query execution performance, it may be helpful to rephrase queries using knowledge about the domain and the application.

The overall goal of manual query performance optimization is to ensure that only necessary data is retrieved from the graph. At the very least, data should get filtered out as early as possible in order to reduce the amount of work that has to be done in the later stages of query execution. This also applies to what gets returned: returning whole nodes and relationships ought to be avoided in favour of selecting and returning only the data that is needed. You should also make sure to set an upper limit on variable length patterns, so they don’t cover larger portions of the dataset than needed.

Each Cypher query gets optimized and transformed into an execution plan by the Cypher query planner. To minimize the resources used for this, try to use parameters instead of literals when possible. This allows Cypher to re-use your queries instead of having to parse and build new execution plans.

To read more about the execution plan operators mentioned in this chapter, see Execution plans.

  - Introduction
26.1. Cypher query options

This section describes the query options available in Cypher.

Query execution can be fine-tuned through the use of query options. In order to use one or more of these options, the query must be prepended with `CYPHER`, followed by the query option(s), as exemplified thus: `CYPHER query-option [further-query-options] query`.

### 26.1.1. Cypher version

Occasionally, there is a requirement to use a previous version of the Cypher compiler when running a query. Here we detail the available versions:

<table>
<thead>
<tr>
<th>Query option</th>
<th>Description</th>
<th>Default</th>
</tr>
</thead>
<tbody>
<tr>
<td>3.5</td>
<td>This will force the query to use Neo4j Cypher 3.5.</td>
<td></td>
</tr>
<tr>
<td>4.2</td>
<td>This will force the query to use Neo4j Cypher 4.2.</td>
<td></td>
</tr>
<tr>
<td>4.3</td>
<td>This will force the query to use Neo4j Cypher 4.3. As this is the default version, it is not necessary to use this option explicitly.</td>
<td>✓</td>
</tr>
</tbody>
</table>

In Neo4j 4.3, the support for Cypher 3.5 is provided only at the parser level. The consequence is that some underlying features available in Neo4j 3.5 are no longer available and will result in runtime errors.

Please refer to the discussion in Cypher Compatibility for more information on which features are affected.

### 26.1.2. Cypher runtime

Using the execution plan, the query is executed — and records returned — by the Cypher runtime. Depending on whether Neo4j Enterprise Edition or Neo4j Community Edition is used, there are three different runtimes available:

**Interpreted**

In this runtime, the operators in the execution plan are chained together in a tree, where each non-leaf operator feeds from one or two child operators. The tree thus comprises nested iterators, and the
records are streamed in a pipelined manner from the top iterator, which pulls from the next iterator and so on.

**Slotted**

This is very similar to the interpreted runtime, except that there are additional optimizations regarding the way in which the records are streamed through the iterators. This results in improvements to both the performance and memory usage of the query. In effect, this can be thought of as the 'faster interpreted' runtime.

**Pipelined**

The pipelined runtime was introduced in Neo4j 4.0 as a replacement for the older compiled runtime used in the Neo4j 3.x versions. It combines some of the advantages of the compiled runtime in a new architecture that allows for support of a wider range of queries.

Algorithms are employed to intelligently group the operators in the execution plan in order to generate new combinations and orders of execution which are optimised for performance and memory usage. While this should lead to superior performance in most cases (over both the interpreted and slotted runtimes), it is still under development and does not support all possible operators or queries (the slotted runtime covers all operators and queries).

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
<th>Default</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>runtime=interpreted</code></td>
<td>This will force the query planner to use the interpreted runtime.</td>
<td>This is not used in Enterprise Edition unless explicitly asked for. It is the only option for all queries in Community Edition—it is not necessary to specify this option in Community Edition.</td>
</tr>
<tr>
<td><code>runtime=slotted</code></td>
<td>This will cause the query planner to use the slotted runtime.</td>
<td>This is the default option for all queries which are not supported by <code>runtime=pipelined</code> in Enterprise Edition.</td>
</tr>
</tbody>
</table>
### 26.1.3. Cypher planner

The Cypher planner takes a Cypher query and computes an execution plan that solves it. For any given query there is likely a number of execution plan candidates that each solve the query in a different way. The planner uses a search algorithm to find the execution plan with the lowest estimated execution cost.

This table describes the available planner options:

<table>
<thead>
<tr>
<th>Query option</th>
<th>Description</th>
<th>Default</th>
</tr>
</thead>
<tbody>
<tr>
<td>planner=cost</td>
<td>Use cost based planning with default limits on plan search space and time.</td>
<td>✔️</td>
</tr>
<tr>
<td>planner=idp</td>
<td>Synonym for <code>planner=cost</code>.</td>
<td></td>
</tr>
<tr>
<td>planner=dp</td>
<td>Use cost based planning without limits on plan search space and time to perform an exhaustive search for the best execution plan.</td>
<td></td>
</tr>
</tbody>
</table>

Using this option can significantly increase the planning time of the query.

### 26.1.4. Cypher connect-components planner

One part of the Cypher planner is responsible for combining sub-plans for separate patterns into larger plans - a task referred to as connecting components.

This table describes the available query options for the connect-components planner:
26.1.5. Cypher update strategy

This option affects the eagerness of updating queries.

The possible values are:

<table>
<thead>
<tr>
<th>Query option</th>
<th>Description</th>
<th>Default</th>
</tr>
</thead>
<tbody>
<tr>
<td>updateStrategy=default</td>
<td>Update queries are executed eagerly when needed.</td>
<td>✔️</td>
</tr>
<tr>
<td>updateStrategy=eager</td>
<td>Update queries are always executed eagerly.</td>
<td></td>
</tr>
</tbody>
</table>

26.1.6. Cypher expression engine

This option affects how the runtime evaluates expressions.

The possible values are:

<table>
<thead>
<tr>
<th>Query option</th>
<th>Description</th>
<th>Default</th>
</tr>
</thead>
<tbody>
<tr>
<td>expressionEngine=default</td>
<td>Compile expressions and use the compiled expression engine when needed.</td>
<td>✔️</td>
</tr>
<tr>
<td>expressionEngine=interpreted</td>
<td>Always use the interpreted expression engine.</td>
<td></td>
</tr>
<tr>
<td>Query option</td>
<td>Description</td>
<td>Default</td>
</tr>
<tr>
<td>------------------------</td>
<td>---------------------------------------------------------------</td>
<td>---------</td>
</tr>
<tr>
<td>expressionEngine=compiled</td>
<td>Always compile expressions and use the compiled expression engine. Cannot be used together with runtime=interpreted.</td>
<td></td>
</tr>
</tbody>
</table>

26.1.7. Cypher operator engine

This query option affects whether the pipelined runtime attempts to generate compiled code for groups of operators.

The possible values are:

<table>
<thead>
<tr>
<th>Query option</th>
<th>Description</th>
<th>Default</th>
</tr>
</thead>
<tbody>
<tr>
<td>operatorEngine=default</td>
<td>Attempt to generate compiled operators when applicable.</td>
<td>✔️</td>
</tr>
<tr>
<td>operatorEngine=interpreted</td>
<td>Never attempt to generate compiled operators.</td>
<td></td>
</tr>
<tr>
<td>operatorEngine=compiled</td>
<td>Always attempt to generate compiled operators. Cannot be used together with runtime=interpreted or runtime=slotted.</td>
<td></td>
</tr>
</tbody>
</table>

26.1.8. Cypher interpreted pipes fallback

This query option affects how the pipelined runtime behaves for operators it does not directly support.

The available options are:

<table>
<thead>
<tr>
<th>Query option</th>
<th>Description</th>
<th>Default</th>
</tr>
</thead>
<tbody>
<tr>
<td>interpretedPipesFallback=default</td>
<td>Equivalent to interpretedPipesFallback=whitelisted_plans_only</td>
<td>✔️</td>
</tr>
<tr>
<td>interpretedPipesFallback=disabled</td>
<td>If the plan contains any operators not supported by the pipelined runtime then another runtime is chosen to execute the entire plan. Cannot be used together with runtime=interpreted or runtime=slotted.</td>
<td></td>
</tr>
<tr>
<td>Query option</td>
<td>Description</td>
<td>Default</td>
</tr>
<tr>
<td>--------------</td>
<td>-------------</td>
<td>---------</td>
</tr>
<tr>
<td>interpretedPipesFallback=whitelisted_plans_only</td>
<td>Parts of the execution plan can be executed on another runtime. Only certain operators are allowed to execute on another runtime. Cannot be used together with runtime=interpreted or runtime=slotted.</td>
<td></td>
</tr>
<tr>
<td>interpretedPipesFallback=all</td>
<td>Parts of the execution plan may be executed on another runtime. Any operator is allowed to execute on another runtime. Queries with this option set might produce incorrect results, or fail. Cannot be used together with runtime=interpreted or runtime=slotted.</td>
<td>! This setting is experimental, and using it in a production environment is discouraged.</td>
</tr>
</tbody>
</table>

### 26.1.9. Cypher replanning

Cypher replanning occurs in the following circumstances:

- When the query is not in the cache. This can either be when the server is first started or restarted, if the cache has recently been cleared, or if `dbms.query_cache_size` was exceeded.
- When the time has past the `cypher.min_replan_interval` value, and the database statistics have changed more than the `cypher.statistics_divergence_threshold` value.

There may be situations where Cypher query planning can occur at a non-ideal time. For example, when a query must be as fast as possible and a valid plan is already in place.

Replanning is not performed for all queries at once; it is performed in the same thread as running the query, and can block the query. However, replanning one query does not replan any other queries.

There are three different replan options available:

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
<th>Default</th>
</tr>
</thead>
<tbody>
<tr>
<td>replan=default</td>
<td>This is the planning and replanning option as described above.</td>
<td>✔</td>
</tr>
<tr>
<td>Option</td>
<td>Description</td>
<td>Default</td>
</tr>
<tr>
<td>-----------------</td>
<td>-----------------------------------------------------------------------------</td>
<td>---------</td>
</tr>
<tr>
<td>replan=force</td>
<td>This will force a replan, even if the plan is valid according to the planning rules. Once the new plan is complete, it replaces the existing one in the query cache.</td>
<td></td>
</tr>
<tr>
<td>replan=skip</td>
<td>If a valid plan already exists, it will be used even if the planning rules would normally dictate that it should be replanned.</td>
<td></td>
</tr>
</tbody>
</table>

The replan option is prepended to queries. For example:

```
CYPHER replan=force MATCH ...
```

In a mixed workload, you can force replanning by using the Cypher EXPLAIN commands. This can be useful to schedule replanning of queries which are expensive to plan, at known times of low load. Using EXPLAIN will make sure the query is only planned, but not executed. For example:

```
CYPHER replan=force EXPLAIN MATCH ...
```

During times of known high load, replan=skip can be useful to not introduce unwanted latency spikes.

### 26.2. Profiling a query

There are two options to choose from when you want to analyze a query by looking at its execution plan:

**EXPLAIN**

If you want to see the execution plan but not run the statement, prepend your Cypher statement with `EXPLAIN`. The statement will always return an empty result and make no changes to the database.

**PROFILE**

If you want to run the statement and see which operators are doing most of the work, use `PROFILE`. This will run your statement and keep track of how many rows pass through each operator, and how much each operator needs to interact with the storage layer to retrieve the necessary data. Note that profiling your query uses more resources, so you should not profile unless you are actively working on a query.

See Execution plans for a detailed explanation of each of the operators contained in an execution plan.

- Being explicit about what types and labels you expect relationships and nodes to have in your query helps Neo4j use the best possible statistical information, which leads to better execution plans. This means that when you know that a relationship can only be of a certain type, you should add that to the query. The same goes for labels, where declaring labels on both the start and end nodes of a relationship helps Neo4j find the best way to execute the statement.
26.3. The use of indexes

This section describes the query plans when indexes are used in various scenarios.

The task of tuning calls for different indexes depending on what the queries look like. Therefore, it is important to have a fundamental understanding of how the indexes operate. This section describes the query plans that result from different index scenarios.

Node indexes and relationship indexes operate in the same way. Therefore, node and relationship indexes are used interchangeably in this section.

Please refer to Indexes for search performance for instructions on how to create and maintain the indexes themselves.

26.3.1. Node index example

In the example below, the query uses a Person(firstname) node index, if it exists.

Query

MATCH (person:Person {firstname: 'Andy'}) RETURN person

Query Plan

Compiler CYPHER 4.3
Planner COST
Runtime PIPELINED
Runtime version 4.3

| Operator        | Details                                                  | Estimated Rows | Rows | DB Hits | Memory (Bytes) | Page Cache Hits/Misses | Time (ms) | Other               |
|-----------------+----------------------------------------------------------+----------------+------|---------+----------------+------------------------+-----------|---------------------|
| +ProduceResults | person                                                   |              1 |    1 |         0 |                |                        |           | Fused in Pipeline 0 |
| |               +----------------------------------------------------------+----------------+------|
| +NodeIndexSeek  | person:Person(firstname) WHERE firstname = $autostring_0 |              1 |    1 |         2 |             72 |                    2/1 |     0.623 | Fused in Pipeline 0 |
| |               +----------------------------------------------------------+----------------+------|
|               +----------------------------------------------------------+----------------+------|
| Total database accesses: 2, total allocated memory: 136

26.3.2. Relationship index example

In this example, the query uses a KNOWS(since) relationship index, if it exists.

Query

MATCH (person)-[relationship:KNOWS { since: 1992 }]->(friend) RETURN person, friend
### 26.3.3. Equality check using WHERE (single-property index)

A query containing equality comparisons of a single indexed property in the `WHERE` clause is backed automatically by the index. It is also possible for a query with multiple OR predicates to use multiple indexes, if indexes exist on the properties. For example, if indexes exist on both `:Label(p1)` and `:Label(p2)`, \[\text{MATCH (n:Label) WHERE n.p1 = 1 OR n.p2 = 2 RETURN n}\] will use both indexes.

**Query**

```cypher
MATCH (person:Person) WHERE person.firstname = 'Andy' RETURN person
```
### Query Plan

Compiler CYPHER 4.3  
Planner COST  
Runtime PIPELINED  
Runtime version 4.3

| Operator        | Details                                                  | Estimated Rows | Rows | DB Hits | Memory (Bytes) | Page Cache Hits/Misses | Time (ms) | Other               |
|-----------------|----------------------------------------------------------|----------------+------+---------+----------------+------------------------+-----------+---------------------+
| +ProduceResults | person                                                   | 1              | 1    |         |                |                        |           | Fused in Pipeline 0 |
| | +----------------------------------------------------------|----------------+------+---------+----------------+------------------------+-----------+---------------------+
| +NodeIndexSeek  | person:Person(firstname) WHERE firstname = $autostring_0 | 1              | 1    | 2       | 72             | 2/1                    | 2.093     | Fused in Pipeline 0 |
| | +----------------------------------------------------------|----------------+------+---------+----------------+------------------------+-----------+---------------------+

Total database accesses: 2, total allocated memory: 136

### 26.3.4. Equality check using WHERE (composite index)

A query containing equality comparisons for all the properties of a composite index will automatically be backed by the same index. However, the query does not need to have equality on all properties. It can have ranges and existence predicates as well. But in these cases rewrites might happen depending on which properties have which predicates, see composite index limitations. The following query will use the composite index defined earlier:

**Query**

```
MATCH (n:Person) WHERE n.age = 35 AND n.country = 'UK' RETURN n
```

However, the query `MATCH (n:Person) WHERE n.age = 35 RETURN n` will not be backed by the composite index, as the query does not contain a predicate on the `country` property. It will only be backed by an index on the `Person` label and `age` property defined thus: `:Person(age)`; i.e. a single-property index.

**Result**

```
| n                                                                                         |
| Node[0]{country:"UK",firstname:"John",highScore:54321,surname:"Smith",name:"john",age:35} |
```

1 row

### 26.3.5. Range comparisons using WHERE (single-property index)

Single-property indexes are also automatically used for inequality (range) comparisons of an indexed property in the WHERE clause.
26.3.6. Range comparisons using **WHERE** (composite index)

Composite indexes are also automatically used for inequality (range) comparisons of indexed properties in the **WHERE** clause. Equality or list membership check predicates may precede the range predicate. However, predicates after the range predicate may be rewritten as an existence check predicate and a filter as described in **composite index limitations**.
26.3.7. Multiple range comparisons using \texttt{WHERE} (single-property index)

When the \texttt{WHERE} clause contains multiple inequality (range) comparisons for the same property, these can be combined in a single index range seek.

\textbf{Query}

\begin{verbatim}
MATCH (person:Person) WHERE 10000 < person.highScore < 20000 RETURN person
\end{verbatim}
26.3.8. Multiple range comparisons using \texttt{WHERE} (composite index)

When the \texttt{WHERE} clause contains multiple inequality (range) comparisons for the same property, these can be combined in a single index range seek. That single range seek created in the following query will then use the composite index \texttt{Person(highScore, name)} if it exists.

\textbf{Query}

```cypher
MATCH (\texttt{person}:Person) WHERE \texttt{10000 < person.highScore < 20000 AND person.name IS NOT NULL}
RETURN \texttt{person}
```
### Query Plan

<td>1</td>
<td>2</td>
<td>72</td>
<td>2/1</td>
<td>5.529</td>
<td></td>
</tr>
</tbody>
</table>

Total database accesses: 2, total allocated memory: 136

### 26.3.9. List membership check using `IN` (single-property index)

The `IN` predicate on `r.since` in the following query will use the single-property index `KNOWS(since)` if it exists.

#### Query

```cypher
MATCH (person)-[:KNOWS]->(friend) WHERE r.since IN [1992, 2017] RETURN person, friend
```
Query Plan

Compiler CYPHER 4.3
Planner COST
Runtime PIPELINED
Runtime version 4.3

<table>
<thead>
<tr>
<th>Operator</th>
<th>Details</th>
</tr>
</thead>
</table>
| Estimated Rows | Rows | DB Hits | Memory (Bytes) | Page Cache Hits/Misses | Time (ms) | Other
| +ProduceResults                | person, friend                                                 |
| 1 |    1 |       0 |                |                        |           | Fused in Pipeline 0 |
| +DirectedRelationshipIndexSeek | (person)-[r:KNOWS(since)]->(friend) WHERE since IN $autolist_0 |
| 1 |    1 |       4 |             72 |                    3/1 |     1.092 | Fused in Pipeline 0 |

Total database accesses: 4, total allocated memory: 136

26.3.10. List membership check using IN (composite index)

The IN predicates on r.since and r.lastMet in the following query will use the composite index KNOWS(since, lastMet) if it exists.

Query

### 26.3.11. Prefix search using \texttt{STARTS WITH} (single-property index)

The \texttt{STARTS WITH} predicate on \texttt{person.firstname} in the following query will use the \texttt{Person(firstname)} index, if it exists.

**Query**

```
MATCH (person:Person) WHERE person.firstname \texttt{STARTS WITH} 'And' RETURN person
```
26.3.12. Prefix search using **STARTS WITH** (composite index)

The **STARTS WITH** predicate on `person.firstname` in the following query will use the `Person(firstname,surname)` index, if it exists. Any (non-existence check) predicate on `person.surname` will be rewritten as existence check with a filter. However, if the predicate on `person.firstname` is a equality check then a **STARTS WITH** on `person.surname` would also use the index (without rewrites). More information about how the rewriting works can be found in composite index limitations.

**Query**

```
MATCH (person:Person) WHERE person.firstname STARTS WITH 'And' AND person.surname IS NOT NULL RETURN person
```
### Query Plan

<td>1</td>
<td>2</td>
<td>72</td>
<td>3/0</td>
<td>1.237</td>
<td>Fused in Pipeline 0</td>
</tr>
</tbody>
</table>

Total database accesses: 2, total allocated memory: 136

### 26.3.13. Suffix search using **ENDS WITH** (single-property index)

The **ENDS WITH** predicate on `r.metIn` in the following query uses the `KNOWS(metIn)` index, if it exists. All values stored in the `KNOWS(metIn)` index are searched, and entries ending with 'mo' are returned. This means that although the search is not optimized to the extent of queries using `=, IN, >, <` or **STARTS WITH**, it is still faster than not using an index in the first place.

**Query**

```
MATCH (person)-[r:KNOWS]->(friend) WHERE r.metIn ENDS WITH 'mo' RETURN person, friend
```
### 26.3.14. Suffix search using `ENDS WITH` (composite index)

The `ENDS WITH` predicate on `r.metIn` in the following query uses the `KNOWS(metIn,lastMetIn)` index, if it exists. However, it is rewritten as existence check and a filter due to the index not supporting actual suffix searches for composite indexes, this is still faster than not using an index in the first place. Any (non-existence check) predicate on `KNOWS.lastMetIn` is also rewritten as existence check with a filter. More information about how the rewriting works can be found in [composite index limitations](#).

**Query**

```cypher
MATCH (person)-[r:KNOWS]->(friend) WHERE r.metIn ENDS WITH 'mo' AND r.lastMetIn IS NOT NULL RETURN person, friend
```
26.3.15. Substring search using CONTAINS (single-property index)

The CONTAINS predicate on `person.firstname` in the following query will use the `Person(firstname)` index, if it exists. All values stored in the `Person(firstname)` index will be searched, and entries containing 'h' will be returned. This means that although the search will not be optimized to the extent of queries using =, IN, >, < or STARTS WITH, it is still faster than not using an index in the first place. Composite indexes are currently not able to support CONTAINS.

Query

```
MATCH (person:Person) WHERE person.firstname CONTAINS 'h' RETURN person
```
26.3.16. Substring search using **CONTAINS** (composite index)

The **CONTAINS** predicate on `person.surname` in the following query will use the `Person(surname,age)` index, if it exists. However, it will be rewritten as existence check and a filter due to the index not supporting actual suffix searches for composite indexes, this is still faster than not using an index in the first place. Any (non-existence check) predicate on `person.age` will also be rewritten as existence check with a filter. More information about how the rewriting works can be found in composite index limitations.

**Query**

```cypher
MATCH (person:Person) WHERE person.surname CONTAINS '300' AND person.age IS NOT NULL RETURN person
```
26.3.17. Existence check using IS NOT NULL (single-property index)

The r.since IS NOT NULL predicate in the following query uses the KNOWS(since) index, if it exists.

Query

```
MATCH (person)-[r:KNOWS]->(friend) WHERE r.since IS NOT NULL RETURN person, friend
```
26.3.18. Existence check using **IS NOT NULL** (composite index)

The `p.firstname IS NOT NULL` and `p.surname IS NOT NULL` predicates in the following query will use the `Person(firstname,surname)` index, if it exists. Any (non-existence check) predicate on `person.surname` will be rewritten as existence check with a filter.

**Query**

```
MATCH (p:Person) WHERE p.firstname IS NOT NULL AND p.surname IS NOT NULL RETURN p
```
26.3.19. Spatial distance searches (single-property index)

If a property with point values is indexed, the index is used for spatial distance searches as well as for range queries.

Query

```
MATCH ()-[r:KNOWS]->() WHERE distance(r.lastMetPoint, point({x: 1, y: 2})) < 2 RETURN r.lastMetPoint
```
### 26.3.20. Spatial distance searches (composite index)

If a property with point values is indexed, the index is used for spatial distance searches as well as for range queries. Any following (non-existence check) predicates (here on property `p.name` for index `:Person(place,name)`) will be rewritten as existence check with a filter.

**Query**

```
MATCH (p:Person) WHERE distance(p.place, point({x: 1, y: 2})) < 2 AND p.name IS NOT NULL RETURN p.place
```

### 26.3.21. Spatial bounding box searches (single-property index)

The ability to do index seeks on bounded ranges works even with the 2D and 3D spatial `Point` types.

**Query**

```cypher
MATCH (person:Person) WHERE point({x: 1, y: 5}) < person.location < point({x: 2, y: 6}) RETURN person
```
26.3.22. Spatial bounding box searches (composite index)

The ability to do index seeks on bounded ranges works even with the 2D and 3D spatial Point types. Any following (non-existence check) predicates (here on property p.firstname for index :Person(place,firstname)) will be rewritten as existence check with a filter. For index :Person(firstname,place), if the predicate on firstname is equality or list membership then the bounded range is handled as a range itself. If the predicate on firstname is anything else then the bounded range is rewritten to existence and filter.

Query

```cypher
MATCH (person:Person) WHERE point({x: 1, y: 5}) < person.place < point({x: 2, y: 6}) AND person.firstname IS NOT NULL RETURN person
```
26.4. Basic query tuning example

This section describes how to profile a query, by using optimizations based on native index capabilities.

We'll start with a basic example to help you get the hang of profiling queries. The following examples will use a movies data set.

26.4.1. The data set

In this section, examples demonstrates the impact native indexes can have on query performance under certain conditions. You will use a movies dataset to illustrate this more advanced query tuning.

In this tutorial, you import data from the following CSV files:

- movies.csv
- actors.csv
- directors.csv
Movies

The movies.csv file contains two columns title, released and tagline.

The content of the movies.csv file:

movies.csv

title, released, tagline
Something's Gotta Give,1975, null
Johnny Mnemonic, 1995, The hottest data on earth. In the coolest head in town
The Replacements, 2000, "Pain heals, Chicks dig scars... Glory lasts forever"
The Devil's Advocate, 1997, Evil has its winning ways
The Matrix Revolutions, 2003, Everything that has a beginning has an end
The Matrix, 1999, Welcome to the Real World
The Matrix Reloaded, 2003, Free your mind
The Matrix Revolutions, 2003, Everything that has a beginning has an end
The Matrix Reloaded, 2003, Free your mind
The Matrix, 1999, Welcome to the Real World
The Matrix Revolutions, 2003, Everything that has a beginning has an end
The Matrix Reloaded, 2003, Free your mind
V for Vendetta, 2006, Freedom! Forever!
Cloud Atlas, 2012, Everything is connected
The Matrix Revolutions, 2003, Everything that has a beginning has an end
The Matrix Reloaded, 2003, Free your mind
The Matrix, 1999, Welcome to the Real World
Speed Racer, 2008, Speed has no limits
Cloud Atlas, 2012, Everything is connected

Directors

The `directors.csv` file contains two columns **title**, **name** and **born**.

The content of the `directors.csv` file:
26.4.2. Prerequisites

The example uses the Linux or macOS tarball installation. It assumes that your current work directory is the `<neo4j-home>` directory of the tarball installation, and the CSV files are placed in the default import directory.

- For the default directory of other installations see, Operations Manual → File locations.
- The import location can be configured with Operations Manual → dbms.directories.import.

26.4.3. Importing the data

Import the movies.csv file
LOAD CSV WITH HEADERS FROM 'file:///movies.csv' AS line
MERGE (m:Movie {title: line.title})
ON CREATE SET
  m.released = toInteger(line.released),
  m.tagline = line.tagline

Added 38 nodes, Set 114 properties, Added 38 labels

Import the actors.csv file

LOAD CSV WITH HEADERS FROM 'file:///actors.csv' AS line
MATCH (m:Movie {title: line.title})
MERGE (p:Person {name: line.name})
ON CREATE SET p.born = toInteger(line.born)
MERGE (p)-[:ACTED_IN {roles:split(line.roles, ';')}]-(m)

Added 102 nodes, Created 172 relationships, Set 375 properties, Added 102 labels

Import the directors.csv file

LOAD CSV WITH HEADERS FROM 'file:///directors.csv' AS line
MATCH (m:Movie {title: line.title})
MERGE (p:Person {name: line.name})
ON CREATE SET p.born = toInteger(line.born)
MERGE (p)-[:DIRECTED]-(m)

Added 23 nodes, Created 44 relationships, Set 46 properties, Added 23 labels

26.4.4. Profile query

Let's say you want to write a query to find 'Tom Hanks'.

The naive way of doing this would be to write the following:

MATCH (p {name: 'Tom Hanks'})
RETURN p

This query will find the 'Tom Hanks' node but as the number of nodes in the database increase it will become slower and slower. We can profile the query to find out why that is.

You can learn more about the options for profiling queries in Query tuning but in this case we’re going to prefix our query with PROFILE:

PROFILE MATCH (p {name: 'Tom Hanks'})
RETURN p
The first thing to keep in mind when reading execution plans is that you need to read from the bottom up.

In that vein, starting from the last row, the first thing we notice is that the value in the `Rows` column seems high given there is only one node with the name property 'Tom Hanks' in the database. If we look across to the `Operator` column we'll see that `AllNodesScan` has been used which means that the query planner scanned through all the nodes in the database.

The `Filter` operator which will check the `name` property on each of the nodes passed through by `AllNodesScan`.

This seems like an inefficient way of finding 'Tom Hanks' given that we are looking at many nodes that aren’t even people and therefore aren’t what we’re looking for.

The solution to this problem is that whenever we’re looking for a node we should specify a label to help the query planner narrow down the search space.

For this query we’d need to add a `Person` label.

```
MATCH (p:Person {name: 'Tom Hanks'})
RETURN p
```

This query will be faster than the first one but as the number of people in our database increase we again notice that the query slows down.

Again we can profile the query to work out why:
This time the `Rows` value on the last row has reduced so we're not scanning some nodes that we were before which is a good start. The `NodeByLabelScan` operator indicates that we achieved this by first doing a linear scan of all the `Person` nodes in the database.

Once we've done that we again scan through all those nodes using the `Filter` operator, comparing the name property of each one.

This might be acceptable in some cases but if we're going to be looking up people by name frequently then we'll see better performance if we create an index on the `name` property for the `Person` label:

```cypher
CREATE INDEX FOR (p:Person)
ON (p.name)
```

Added 1 indexes

```cypher
CALL db.awaitIndexes
```

Now if we run the query again it will run more quickly:

```cypher
MATCH (p:Person { name: 'Tom Hanks'})
RETURN p
```
Let’s profile the query to see why that is:

```cypher
PROFILE
MATCH (p:Person {name: 'Tom Hanks'})
RETURN p
```

Our execution plan is down to a single row and uses the Node Index Seek operator which does an index seek (see Indexes for search performance) to find the appropriate node.

### 26.5. Advanced query tuning example

*This section describes some more subtle optimizations based on native index capabilities.*

One of the most important and useful ways of optimizing Cypher queries involves creating appropriate indexes. This is described in more detail in Indexes for search performance, and demonstrated in Basic query tuning example. In summary, an index will be based on the combination of a Label and a Property. Any Cypher query that searches for nodes with a specific label and some predicate on the property (equality, range or existence) will be planned to use the index if the cost planner deems that to be the most efficient solution.

In order to benefit from enhancements provided by native indexes, it is useful to understand when index-backed property lookup and index-backed order by will come into play. Let’s explain how to use these features with a more advanced query tuning example.

If you are upgrading an existing store to 4.3.16, it may be necessary to drop and re-create existing indexes. For information on native index support and upgrade considerations regarding indexes, see Operations Manual → Indexes.
26.5.1. The data set

In this section, examples demonstrates the impact native indexes can have on query performance under certain conditions. You will use a movies dataset to illustrate this more advanced query tuning.

In this tutorial, you import data from the following CSV files:

- movies.csv
- actors.csv
- directors.csv

Movies

The movies.csv file contains two columns title, released and tagline.

The content of the movies.csv file:

movies.csv

title, released, tagline
Something's Gotta Give, 1975, null
Johnny Mnemonic, 1995, The hottest data on earth. In the coolest head in town
The Replacements, 2000, "Pain heals, Chicks dig scars... Glory lasts forever"

Directors

The directors.csv file contains two columns title, name and born.

The content of the directors.csv file:
## 26.5.2. Prerequisites

The example uses the Linux or macOS tarball installation. It assumes that your current work directory is the `<neo4j-home>` directory of the tarball installation, and the CSV files are placed in the default import directory.

- For the default directory of other installations see, [Operations Manual → File locations](#).
- The import location can be configured with [Operations Manual → dbmsdirectories.import](#).

## 26.5.3. Importing the data

Import the movies.csv file
LOAD CSV WITH HEADERS FROM 'file:///movies.csv' AS line
MERGE (m:Movie {title: line.title})
ON CREATE SET
  m.released = toInteger(line.released),
  m.tagline = line.tagline

Added 38 nodes, Set 114 properties, Added 38 labels

Import the actors.csv file

LOAD CSV WITH HEADERS FROM 'file:///actors.csv' AS line
MATCH (m:Movie {title: line.title})
MERGE (p:Person {name: line.name})
ON CREATE SET p.born = toInteger(line.born)
MERGE (p)-[:ACTED_IN {roles:split(line.roles, ';')}]-(m)

Added 102 nodes, Created 172 relationships, Set 375 properties, Added 102 labels

Import the directors.csv file

LOAD CSV WITH HEADERS FROM 'file:///directors.csv' AS line
MATCH (m:Movie {title: line.title})
MERGE (p:Person {name: line.name})
ON CREATE SET p.born = toInteger(line.born)
MERGE (p)-[:DIRECTED]->(m)

Added 23 nodes, Created 44 relationships, Set 46 properties, Added 23 labels

Create an index for nodes with the Person label

CREATE INDEX FOR (p:Person)
ON (p.name)

Added 1 indexes

CALL db.awaitIndexes

26.5.4. Index-backed property-lookup

In this example you want to write a query to find persons with the name 'Tom' that acted in a movie.

MATCH (p:Person)-[:ACTED_IN]->(m:Movie)
WHERE p.name STARTS WITH 'Tom'
RETURN
  p.name AS name,
  count(m) AS count
The query request the database to return all the actors with the first name 'Tom'. There are three of them: 'Tom Cruise', 'Tom Skerritt' and 'Tom Hanks'. With native indexes, however, you can leverage the fact that indexes store the property values. In this case, it means that the names can be looked up directly from the index. This allows Cypher to avoid the second call to the database to find the property, which can save time on very large queries.

If we profile the above query, we see that the NodeIndexSeekByRange in the Details column contains cache[p.name], which means that p.name is retrieved from the index. We can also see that the OrderedAggregation has no DB Hits, which means it does not have to access the database again.
If we change the query, such that it can no longer use an index, we will see that there will be no cache[p.name] in the Details column, and that the EagerAggregation now has DB Hits, since it accesses the database again to retrieve the name.

```
PROFILE
MATCH (p:Person)-[:ACTED_IN]->(m:Movie)
RETURN p.name AS name,
       count(m) AS count
```

```bash

102 rows

For non-native indexes there will still be a second database access to retrieve those values.

Predicates that can be used to enable this optimization are:

- **Existence** (e.g. WHERE n.name IS NOT NULL)
- **Equality** (e.g. WHERE n.name = 'Tom Hanks')
- **Range** (e.g. WHERE n.uid > 1000 AND n.uid < 2000)
- **Prefix** (e.g. WHERE n.name STARTS WITH 'Tom')
• Suffix (e.g. \texttt{WHERE n.name ENDS WITH 'Hanks'}

• Substring (e.g. \texttt{WHERE n.name CONTAINS 'a'}

• Several predicates of the above types combined using \texttt{OR}, given that all of them are on the same property (e.g. \texttt{WHERE n.prop < 10 OR n.prop = 'infinity'}

If there is an existence constraint on the property, no predicate is required to trigger the optimization. For example, \texttt{CREATE CONSTRAINT constraint_name ON (p:Person) ASSERT p.name IS NOT NULL}.

Aggregating functions

For all built-in aggregating functions in Cypher, the index-backed property-lookup optimization can be used even without a predicate.

Consider this query which returns the number of distinct names of people in the movies dataset:

\begin{verbatim}
MATCH (p:Person)
RETURN count(DISTINCT p.name) AS numberOfNames
\end{verbatim}

<table>
<thead>
<tr>
<th>numberOfNames</th>
</tr>
</thead>
<tbody>
<tr>
<td>125</td>
</tr>
</tbody>
</table>

+-------------------------+------------------------------------------------------+----------------+------+
| Operator                | Details                                              | Estimated Rows | Rows |
| +ProduceResults@neo4j   | numberOfNames                                        |              1 |    1 |
| |                       |                                                     | 0/0           | 0.048 | In Pipeline 1 |
| +EagerAggregation@neo4j | count(DISTINCT cache[p.name]) AS numberOfNames       |              1 |    1 |
| |                       |                                                     | 9888          |       | Fused in Pipeline 0 |
| +NodeIndexScan@neo4j    | p:Person(name) WHERE name IS NOT NULL, cache[p.name] |              125| 125   |
| |                       |                                                     | 72            | 1/0   | 1.569 | Fused in Pipeline 0 |

1 row

Note that the \texttt{NodeIndexScan} in the Details column contains \texttt{cache[p.name]} and that the \texttt{EagerAggregation} has no \texttt{DB Hits}. In this case, the semantics of aggregating functions works like an implicit existence predicate because \texttt{Person} nodes without the property \texttt{name} will not affect the result of an aggregation.
26.5.5. Index-backed order by

Now consider the following refinement to the query:

```cypher
PROFILE
MATCH (p:Person)-[:ACTED_IN]->(m:Movie)
WHERE p.name STARTS WITH 'Tom'
RETURN
  p.name AS name,
  count(m) AS count
ORDER BY name
```

<table>
<thead>
<tr>
<th>name</th>
<th>count</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;Tom Cruise&quot;</td>
<td>3</td>
</tr>
<tr>
<td>&quot;Tom Hanks&quot;</td>
<td>12</td>
</tr>
<tr>
<td>&quot;Tom Skerritt&quot;</td>
<td>1</td>
</tr>
</tbody>
</table>

We are asking for the results in ascending alphabetical order. The native index happens to store String
properties in ascending alphabetical order, and Cypher knows this. In Neo4j 3.5 and later, the Cypher planner will recognize that the index already returns data in the correct order, and skip the Sort operation.

The Order by column describes the order of rows after each operator. We see that the Order by column contains p.name ASC from the index seek operation, meaning that the rows are ordered by p.name in ascending order.

Index-backed order by can also be used for queries that expect their results is descending order, but with slightly lower performance.

In cases where the Cypher planner is unable to remove the Sort operator, the planner can utilize knowledge of the ORDER BY clause to plan the Sort operator at a point in the plan with optimal cardinality.

min() and max()

For the min and max functions, the index-backed order by optimization can be used to avoid aggregation and instead utilize the fact that the minimum/maximum value is the first/last one in a sorted index. Consider the following query which returns the first actor in alphabetical order:

```
PROFILE
MATCH (p:Person)-[:ACTED_IN]->(m:Movie)
RETURN min(p.name) AS name
```
Aggregations are usually using the `EagerAggregation` operation. This would mean scanning all nodes in the index to find the name that is first in alphabetic order. Instead, the query is planned with `Projection`, followed by `Limit`, followed by `Optional`. This will simply pick the first value from the index.

For large datasets, this can improve performance dramatically.

Index-backed order by can also be used for corresponding queries with the `max` function, but with slightly lower performance.

**Restrictions**

The optimization can only work on native indexes. It does not work for predicates only querying for the spatial type `Point`.

Predicates that can be used to enable this optimization are:

- Existence (e.g. `WHERE n.name IS NOT NULL`)
- Equality (e.g. `WHERE n.name = 'Tom Hanks'`)
- Range (e.g. `WHERE n.uid > 1000 AND n.uid < 2000`)
- Prefix (e.g. `WHERE n.name STARTS WITH 'Tom'`)

```sql
<table>
<thead>
<tr>

<td>&quot;CYPHER 4.3&quot;</td>
<td>&quot;COST&quot;</td>
<td>&quot;PIPEDLINE&quot;</td>
<td>38</td>
<td>809</td>
<td>1</td>
<td>184</td>
</tr>
</tbody>
</table>
```

```sql
+-------------------------+-----------------------------+----------------+------+---------+
| Operator                | Details                     | Estimated Rows | Rows | DB Hits | Memory (Bytes) |
| +ProduceResults@neo4j   | name                        |              1 |    1 |       0 |             0 |
|                       | 0/0 |     0.041 | In Pipeline 1 |        |
| +EagerAggregation@neo4j | min(p.name) AS name         |              1 |    1 |     344 |             32 |
|                        | Fused in Pipeline 0 |        |
| +Filter@neo4j           | p:Person                    |            172 |  172 |     172 |             72 |
|                        | Fused in Pipeline 0 |        |
| +Expand(All)@neo4j      | (m)<-[anon_16:ACTED_IN]-(p) |            172 |  172 |     254 |             72 |
|                        | Fused in Pipeline 0 |        |
| +NodeByIdLabelScan@neo4j| m:Movie                     |             38 |   38 |      39 |             72 |
|                       | 5/0 |     1.636 | Fused in Pipeline 0 |        |
```

1 row
Predicates that will not work:

- Several predicates combined using OR
- Equality or range predicates querying for points (e.g., `WHERE n.place > point({ x: 1, y: 2 })`)
- Spatial distance predicates (e.g., `WHERE distance(n.place, point({ x: 1, y: 2 })) < 2`)

If there is an existence constraint on the property, no predicate is required to trigger the optimization. For example, `CREATE CONSTRAINT constraint_name ON (p:Person) ASSERT p.name IS NOT NULL`.

As of Neo4j 4.3.16, predicates with parameters, such as `WHERE n.prop > $param`, can trigger index-backed order by. The only exception are queries with parameters of type `Point`.

26.6. Planner hints and the USING keyword

A planner hint is used to influence the decisions of the planner when building an execution plan for a query. Planner hints are specified in a query with the `USING` keyword.

Forcing planner behavior is an advanced feature, and should be used with caution by experienced developers and/or database administrators only, as it may cause queries to perform poorly.

26.6.1. Introduction

When executing a query, Neo4j needs to decide where in the query graph to start matching. This is done by looking at the `MATCH` clause and the `WHERE` conditions and using that information to find useful indexes, or other starting points.

However, the selected index might not always be the best choice. Sometimes multiple indexes are possible candidates, and the query planner picks the suboptimal one from a performance point of view. Moreover, in some circumstances (albeit rarely) it is better not to use an index at all.

Neo4j can be forced to use a specific starting point through the `USING` keyword. This is called giving a planner hint. There are four types of planner hints: index hints, scan hints, join hints, and the `PERIODIC COMMIT` query hint.
COMMIT query hint.

Query

MATCH (s:Scientist {born: 1850})-[[:RESEARCHED]->(sc:Science)<-[i:INVENTED_BY {year: 560}]-](p:Pioneer {born: 525})-[[:LIVES_IN]->(c:City)<-[cc:Country {formed: 411}]] RETURN *

The query above will be used in some of the examples on this page. Without any hints, one index and no join is used.

26.6.2. Index hints

Index hints are used to specify which index, the planner should use as a starting point. This can be beneficial in cases where the index statistics are not accurate for the specific values that the query at hand is known to use, which would result in the planner picking a non-optimal index. To supply an index hint, use `USING INDEX variable:Label(property)` or `USING INDEX SEEK variable:Label(property)` after the applicable `MATCH` clause for node indexes, and `USING INDEX variable:RELATIONSHIP_TYPE(property)` or `USING INDEX SEEK variable:RELATIONSHIP_TYPE(property)` for relationship indexes.

`USING INDEX` can be fulfilled by any of the following plans: `NodeIndexScan`, `DirectedRelationshipIndexScan`, `UndirectedRelationshipIndexScan`, `NodeIndexSeek`, `DirectedRelationshipIndexSeek`, `UndirectedRelationshipIndexSeek`. `USING INDEX SEEK` can only be fulfilled by `NodeIndexSeek`, `DirectedRelationshipIndexSeek`, or `UndirectedRelationshipIndexSeek`.

It is possible to supply several index hints, but keep in mind that several starting points will require the use of a potentially expensive join later in the query plan.

Query using a node index hint

The query above can be tuned to pick a different index as the starting point.

Query

```sql
MATCH (s:Scientist {born: 1850})-[:RESEARCHED]->(sc:Science)<-[i:INVENTED_BY {year: 560}]-(:Pioneer {born: 525})-[:LIVES_IN]->(c:City)-[:PART_OF]->(cc:Country {formed: 411})
USING INDEX p:Pioneer(born)
RETURN *
```

Query using multiple index hints

Supplying one index hint changed the starting point of the query, but the plan is still linear, meaning it only has one starting point. If we give the planner yet another index hint, we force it to use two starting points, one at each end of the match. It will then join these two branches using a join operator.
MATCH (s:Scientist {born: 1850})-[[:RESEARCHED]->(sc:Science)<-[:INVENTED_BY]->(i:Inventor {year: 560})]->(p:Pioneer {born: 525})-[[:LIVES_IN]->(c:City)<-[:PART_OF]->(cc:Country {formed: 411})]
USING INDEX s:Scientist(born)
USING INDEX cc:Country(form)
RETURN *
26.6.3. Scan hints

If your query matches large parts of an index, it might be faster to scan the label or relationship type and filter out rows that do not match. To do this, you can use `USING SCAN variable:Label` after the applicable `MATCH` clause for node indexes, and `USING SCAN variable:RELATIONSHIP_TYPE` for relationship indexes. This will force Cypher to not use an index that could have been used, and instead do a label scan/relationship type scan. You can use the same hint to enforce a starting point where no index is applicable.

Hinting a label scan

**Query**

```cypher
MATCH (s:Scientist {born: 1850})-[[:RESEARCHED]]->(sc:Science)<-[[:INVENTED_BY] {year: 560}]-(p:Pioneer {born: 525})-[[:LIVES_IN]]->(c:City)<-[[:PART_OF]]->(cc:Country {formed: 411})
USING SCAN s:Scientist
RETURN *
```

26.6.4. Join hints

Join hints are the most advanced type of hints, and are not used to find starting points for the query execution plan, but to enforce that joins are made at specified points. This implies that there has to be more than one starting point (leaf) in the plan, in order for the query to be able to join the two branches ascending from these leaves. Due to this nature, joins, and subsequently join hints, will force the planner to look for additional starting points, and in the case where there are no more good ones, potentially pick a very bad starting point. This will negatively affect query performance. In other cases, the hint might force the planner to pick a seemingly bad starting point, which in reality proves to be a very good one.

Hinting a join on a single node

In the example above using multiple index hints, we saw that the planner chose to do a join, but not on the `p` node. By supplying a join hint in addition to the index hints, we can enforce the join to happen on the `p` node.

Query

```
MATCH (s:Scientist {born: 1850})-[*:RESEARCHED]->(sc:Science)<-[i:INVENTED_BY {year: 560}]-[:LIVES_IN]-(c:City)<-[i:PART_OF]-(cc:Country {formed: 411})
USING INDEX s:Scientist(born)
USING INDEX cc:Country(formated)
USING JOIN ON p
RETURN *
```
Hinting a join for an OPTIONAL MATCH

A join hint can also be used to force the planner to pick a NodeLeftOuterHashJoin or NodeRightOuterHashJoin to solve an OPTIONAL MATCH. In most cases, the planner will rather use an OptionalExpand.
Without any hint, the planner did not use a join to solve the `OPTIONAL MATCH`.

Now the planner uses a join to solve the `OPTIONAL MATCH`.
26.6.5. **PERIODIC COMMIT** query hint

Importing large amounts of data using `LOAD CSV` with a single Cypher query may fail due to memory constraints. This will manifest itself as an `OutOfMemoryError`.

For this situation only, Cypher provides the global `USING PERIODIC COMMIT` query hint for updating queries using `LOAD CSV`. If required, the limit for the number of rows per commit may be set as follows: `USING PERIODIC COMMIT 500`.

**PERIODIC COMMIT** will process the rows until the number of rows reaches a limit. Then the current transaction will be committed and replaced with a newly opened transaction. If no limit is set, a default value will be used.

See `Importing large amounts of data` in `LOAD CSV` for examples of `USING PERIODIC COMMIT` with and without setting the number of rows per commit.

- **Using PERIODIC COMMIT** will prevent running out of memory when importing large amounts of data. However, it will also break transactional isolation and thus it should only be used where needed.

- **The USE clause** cannot be used together with the `PERIODIC COMMIT` clause.
Chapter 27. Execution plans

This section describes the characteristics of query execution plans and provides details about each of the operators.

Introduction

The task of executing a query is decomposed into operators, each of which implements a specific piece of work. The operators are combined into a tree-like structure called an execution plan. Each operator in the execution plan is represented as a node in the tree. Each operator takes as input zero or more rows, and produces as output zero or more rows. This means that the output from one operator becomes the input for the next operator. Operators that join two branches in the tree combine input from two incoming streams and produce a single output.

Evaluation model

Evaluation of the execution plan begins at the leaf nodes of the tree. Leaf nodes have no input rows and generally comprise operators such as scans and seeks. These operators obtain the data directly from the storage engine, thus incurring database hits. Any rows produced by leaf nodes are then piped into their parent nodes, which in turn pipe their output rows to their parent nodes and so on, all the way up to the root node. The root node produces the final results of the query.

Eager and lazy evaluation

In general, query evaluation is lazy: most operators pipe their output rows to their parent operators as soon as they are produced. This means that a child operator may not be fully exhausted before the parent operator starts consuming the input rows produced by the child.

However, some operators, such as those used for aggregation and sorting, need to aggregate all their rows before they can produce output. Such operators need to complete execution in its entirety before any rows are sent to their parents as input. These operators are called eager operators, and are denoted as such in Execution plan operators at a glance. Eagerness can cause high memory usage and may therefore be the cause of query performance issues.

Statistics

Each operator is annotated with statistics.

Rows

The number of rows that the operator produced. This is only available if the query was profiled.

EstimatedRows

This is the estimated number of rows that is expected to be produced by the operator. The estimate is an approximate number based on the available statistical information. The compiler uses this estimate to choose a suitable execution plan.
DbHits

Each operator will ask the Neo4j storage engine to do work such as retrieving or updating data. A database hit is an abstract unit of this storage engine work. The actions triggering a database hit are listed in Database hits (DbHits).

Page Cache Hits, Page Cache Misses, Page Cache Hit Ratio

These metrics are only shown for some queries when using Neo4j Enterprise Edition. The page cache is used to cache data and avoid accessing disk, so having a high number of hits and a low number of misses will typically make the query run faster. Whenever several operators are fused together for more efficient execution we can no longer associate this metric with a given operator and then nothing will appear here.

Time

Time is only shown for some operators when using the pipelined runtime. The number shown is the time in milliseconds it took to execute the given operator. Whenever several operators are fused together for more efficient execution we can no longer associate a duration with a given operator and then nothing will appear here.

To produce an efficient plan for a query, the Cypher query planner requires information about the Neo4j database. This information includes which indexes and constraints are available, as well as various statistics maintained by the database. The Cypher query planner uses this information to determine which access patterns will produce the best execution plan.

The statistical information maintained by Neo4j is:

1. The number of nodes having a certain label.
2. The number of relationships by type.
3. Selectivity per index.
4. The number of relationships by type, ending with or starting from a node with a specific label.

Information about how the statistics are kept up to date, as well as configuration options for managing query replanning and caching, can be found in the Operations Manual → Statistics and execution plans.

Query tuning describes how to tune Cypher queries. In particular, see Query tuning for how to view the execution plan for a query and Planner hints and the USING keyword for how to use hints to influence the decisions of the planner when building an execution plan for a query.

For a deeper understanding of how each operator works, refer to Execution plan operators at a glance and the linked sections per operator. Please remember that the statistics of the particular database where the queries run will decide the plan used. There is no guarantee that a specific query will always be solved with the same plan.

27.1. Execution plan operators at a glance

This section contains the execution plan operators at a glance.

This table comprises all the execution plan operators ordered lexicographically.
- Leaf operators, in most cases, locate the starting nodes and relationships required in order to execute the query.
- Updating operators are used in queries that update the graph.
- Eager operators accumulate all their rows before piping them to the next operator.

<tr>
<td>VarLengthExpand(Into)</td>
<td>Finds all variable-length relationships between two nodes.</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>VarLengthExpand(Pruning)</td>
<td>Traverses variable-length relationships from a given node and only returns unique end nodes.</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

27.2. Database hits (DbHits)

This section contains an overview of actions that triggers database hits.

Each operator will send a request to the storage engine to do work such as retrieving or updating data. A database hit is an abstract unit of this storage engine work.

We list below all the actions that trigger one or more database hits:

- **Create actions**
  - Create a node
  - Create a relationship
  - Create a new node label
  - Create a new relationship type
  - Create a new ID for property keys with the same name
- **Delete actions**
  - Delete a node
  - Delete a relationship
- **Update actions**
  - Set one or more labels on a node
- Remove one or more labels from a node

- **Node-specific actions**
  - Get a node by its ID
  - Get the degree of a node
  - Determine whether a node is dense
  - Determine whether a label is set on a node
  - Get the labels of a node
  - Get a property of a node
  - Get an existing node label
  - Get the name of a label by its ID, or its ID by its name

- **Relationship-specific actions**
  - Get a relationship by its ID
  - Get a property of a relationship
  - Get an existing relationship type
  - Get a relationship type name by its ID, or its ID by its name

- **General actions**
  - Get the name of a property key by its ID, or its ID by the key name
  - Find a node or relationship through an index seek or index scan
  - Find a path in a variable-length expand
  - Find a shortest path
  - Ask the count store for a value

- **Schema actions**
  - Add an index
  - Drop an index
  - Get the reference of an index
  - Create a constraint
  - Drop a constraint

- Call a procedure
- Call a user-defined function

| Note | The presented value can vary slightly depending on the **Cypher runtime** that was used to execute the query. In the pipelined runtime the number of database hits will typically be higher since it uses a more accurate way of measuring. |
27.3. Execution plan operators in detail

All operators are listed here, grouped by the similarity of their characteristics.

Certain operators are only used by a subset of the runtimes that Cypher can choose from. If that is the case, the example queries will be prefixed with an option to choose one of these runtimes.

27.3.1. All Nodes Scan

The AllNodesScan operator reads all nodes from the node store. The variable that will contain the nodes is seen in the arguments. Any query using this operator is likely to encounter performance problems on a non-trivial database.

Query

```
MATCH (n) RETURN n
```

Query Plan

```

| 0.753 | Fused in Pipeline 0 |
+-----------------+---------+----------------+------+---------+----------------+------------------------+

Total database accesses: 36, total allocated memory: 136

27.3.2. Directed Relationship Index Scan

The DirectedRelationshipIndexScan operator examines all values stored in an index, returning all relationships and their start and end nodes with a particular relationship type and a specified property.

Query

```
MATCH ()-[r:WORKS_IN]->() WHERE r.title IS NOT NULL RETURN r
```
Query Plan

27.3.3. Undirected Relationship Index Scan

The UndirectedRelationshipIndexScan operator examines all values stored in an index, returning all relationships and their start and end nodes with a particular relationship type and a specified property.

Query

MATCH ()-[r:WORKS_IN]-() WHERE r.title IS NOT NULL RETURN r
27.3.4. Directed Relationship Index Seek

The `DirectedRelationshipIndexSeek` operator finds relationships and their start and end nodes using an index seek. The relationship variable and the index used are shown in the arguments of the operator.

**Query**

```cypher
MATCH (candidate)-[r:WORKS_IN]->() WHERE r.title = 'chief architect' RETURN candidate
```
27.3.5. Undirected Relationship Index Seek

The `UndirectedRelationshipIndexSeek` operator finds relationships and their start and end nodes using an index seek. The relationship variable and the index used are shown in the arguments of the operator.

**Query**

```
MATCH (candidate)-[r:WORKS_IN]->() WHERE r.title = 'chief architect' RETURN candidate
```

</tbody>
</table>

Total database accesses: 3, total allocated memory: 136

### 27.3.6. Directed Relationship By Id Seek

The **DirectedRelationshipByIdSeek** operator reads one or more relationships by id from the relationship store, and produces both the relationship and the nodes on either side.

**Query**

```
MATCH (n1)-[r]->()
WHERE id(r) = 0
RETURN r, n1
```
### Query Plan

Compiler CYPHER 4.3

Total database accesses: 1, total allocated memory: 136

#### 27.3.7. Undirected Relationship By Id Seek

The **UndirectedRelationshipByIdSeek** operator reads one or more relationships by id from the relationship store. As the direction is unspecified, two rows are produced for each relationship as a result of alternating the combination of the start and end node.

**Query**

```cypher
MATCH (n1)-[r]->() WHERE id(r) = 1
RETURN r, n1
```

#### Query Plan

Compiler CYPHER 4.3

Total database accesses: 1, total allocated memory: 136
27.3.8. Directed Relationship Index Contains Scan

The DirectedRelationshipIndexContainsScan operator examines all values stored in an index, searching for entries containing a specific string; for example, in queries including CONTAINS. Although this is slower than an index seek (since all entries need to be examined), it is still faster than the indirection resulting from a type scan using DirectedRelationshipTypeScan, and a property store filter.

Query

```
MATCH ()-[r: WORKS_IN]->() WHERE r.title CONTAINS 'senior' RETURN r
```

Query Plan

```

27.3.9. Undirected Relationship Index Contains Scan

The UndirectedRelationshipIndexContainsScan operator examines all values stored in an index, searching for entries containing a specific string; for example, in queries including CONTAINS. Although this is slower than an index seek (since all entries need to be examined), it is still faster than the indirection resulting from a type scan using DirectedRelationshipTypeScan, and a property store filter.

Query

```
MATCH ()-[r: WORKS_IN]-(r) WHERE r.title CONTAINS 'senior' RETURN r
```
27.3.10. Directed Relationship Index Ends With Scan

The `DirectedRelationshipIndexEndsWithScan` operator examines all values stored in an index, searching for entries ending in a specific string; for example, in queries containing `ENDS WITH`. Although this is slower than an index seek (since all entries need to be examined), it is still faster than the indirection resulting from a label scan using `NodeByLabelScan`, and a property store filter.

Query

```
MATCH ()-[r:WORKS_IN]->() WHERE r.title ENDS WITH 'developer' RETURN r
```
27.3.11. Undirected Relationship Index Ends With Scan

The UndirectedRelationshipIndexEndsWithScan operator examines all values stored in an index, searching for entries ending in a specific string; for example, in queries containing ENDS WITH. Although this is slower than an index seek (since all entries need to be examined), it is still faster than the indirection resulting from a label scan using NodeByLabelScan, and a property store filter.

Query

MATCH ()-[r:WORKS_IN]-() WHERE r.title ENDS WITH 'developer' RETURN r
### 27.3.12. Directed Relationship Index Seek By Range

The `DirectedRelationshipIndexSeekByRange` operator finds relationships and their start and end nodes using an index seek where the value of the property matches a given prefix string. `DirectedRelationshipIndexSeekByRange` can be used for `STARTS WITH` and comparison operators such as `<`, `>`, `<=` and `>=`.

**Query**

```
MATCH (candidate: Person)-[r:WORKS_IN]->(location) WHERE r.duration > 100 RETURN candidate
```

27.3.17. Node By Label Scan

The NodeByLabelScan operator fetches all nodes with a specific label from the node label index.

**Query**

```
MATCH (person:Person) RETURN person
```
27.3.18. Node Index Seek

The `NodeIndexSeek` operator finds nodes using an index seek. The node variable and the index used are shown in the arguments of the operator. If the index is a unique index, the operator is instead called `NodeUniqueIndexSeek`.

Query

```cypher
MATCH (location:Location {name: 'Malmo'}) RETURN location
```
27.3.19. Node Unique Index Seek

The NodeUniqueIndexSeek operator finds nodes using an index seek within a unique index. The node variable and the index used are shown in the arguments of the operator. If the index is not unique, the operator is instead called NodeIndexSeek. If the index seek is used to solve a MERGE clause, it will also be marked with (Locking). This makes it clear that any nodes returned from the index will be locked in order to prevent concurrent conflicting updates.

Query

```
MATCH (t:Team {name: 'Malmo'}) RETURN t
```

Query Plan

```

Total database accesses: 1, total allocated memory: 136
```

27.3.20. Multi Node Index Seek

The MultiNodeIndexSeek operator finds nodes using multiple index seeks. It supports using multiple distinct indexes for different nodes in the query. The node variables and the indexes used are shown in the arguments of the operator.

The operator yields a cartesian product of all index seeks. For example, if the operator does two seeks and the first seek finds the nodes $a_1$, $a_2$ and the second $b_1$, $b_2$, $b_3$, the MultiNodeIndexSeek will yield the rows $(a_1, b_1)$, $(a_1, b_2)$, $(a_1, b_3)$, $(a_2, b_1)$, $(a_2, b_2)$, $(a_2, b_3)$.

Query

```
MATCH (location:Location {name: 'Malmo'}), (person:Person {name: 'Bob'}) RETURN location, person
```
27.3.21. Asserting Multi Node Index Seek

The AssertingMultiNodeIndexSeek operator is used to ensure that no unique constraints are violated. The example looks for the presence of a team with the supplied name and id, and if one does not exist, it will be created. Owing to the existence of two unique constraints on :Team(name) and :Team(id), any node that would be found by the UniqueIndexSeek must be the very same node, or the constraints would be violated.

Query

```mergo
MERGE (t:Team {name: 'Engineering', id: 42})
```

### 27.3.22. Node Index Seek By Range

The **NodeIndexSeekByRange** operator finds nodes using an index seek where the value of the property matches a given prefix string. **NodeIndexSeekByRange** can be used for **STARTS WITH** and comparison operators such as `<`, `>`, `<=`, and `>=`. If the index is a unique index, the operator is instead called **NodeUniqueIndexSeekByRange**.

**Query**

```cypher
MATCH (l:Location) WHERE l.name STARTS WITH 'Lon' RETURN l
```
27.3.23. Node Unique Index Seek By Range

The NodeUniqueIndexSeekByRange operator finds nodes using an index seek within a unique index, where the value of the property matches a given prefix string. NodeUniqueIndexSeekByRange is used by STARTS WITH and comparison operators such as <, >, <=, and >=. If the index is not unique, the operator is instead called NodeIndexSeekByRange.

Query

MATCH (t:Team) WHERE t.name STARTS WITH 'Ma' RETURN t
27.3.24. Node Index Contains Scan

The \texttt{NodeIndexContainsScan} operator examines all values stored in an index, searching for entries containing a specific string; for example, in queries including \texttt{CONTAINS}. Although this is slower than an index seek (since all entries need to be examined), it is still faster than the indirection resulting from a label scan using \texttt{NodeByLabelScan}, and a property store filter.

\textbf{Query}

\begin{verbatim}
MATCH (l:Location) WHERE l.name CONTAINS 'al' RETURN l
\end{verbatim}

Total database accesses: 11, total allocated memory: 136
27.3.27. Apply

All the different Apply operators (listed below) share the same basic functionality: they perform a nested loop by taking a single row from the left-hand side, and using the Argument operator on the right-hand side, execute the operator tree on the right-hand side. The versions of the Apply operators differ in how the results are managed. The Apply operator (i.e. the standard version) takes the row produced by the right-hand side — which at this point contains data from both the left-hand and right-hand sides — and yields it.

Total database accesses: 2, total allocated memory: 144

27.3.28. Semi Apply

The SemiApply operator tests for the presence of a pattern predicate, and is a variation of the Apply operator. If the right-hand side operator yields at least one row, the row from the left-hand side operator is yielded by the SemiApply operator. This makes SemiApply a filtering operator, used mostly for pattern predicates in queries.

27.3.29. Anti Semi Apply

The AntiSemiApply operator tests for the absence of a pattern, and is a variation of the Apply operator. If the right-hand side operator yields no rows, the row from the left-hand side operator is yielded by the AntiSemiApply operator. This makes AntiSemiApply a filtering operator, used for pattern predicates in queries.

27.3.31. Let Semi Apply

The **LetSemiApply** operator tests for the presence of a pattern predicate, and is a variation of the **Apply** operator. When a query contains multiple pattern predicates separated with **OR**, **LetSemiApply** will be used to evaluate the first of these. It will record the result of evaluating the predicate but will leave any filtering to another operator. In the example, **LetSemiApply** will be used to check for the presence of the **FRIENDS_WITH** relationship from each person.

**Query**

```
MATCH (other:Person)
WHERE (other)-[:FRIENDS_WITH]->(:Person) OR (other)-[:WORKS_IN]->(:Location)
RETURN other.name
```

### 27.3.33. Select Or Semi Apply

The **SelectOrSemiApply** operator tests for the presence of a pattern predicate and evaluates a predicate, and is a variation of the **Apply** operator. This operator allows for the mixing of normal predicates and pattern predicates that check for the presence of a pattern. First, the normal expression predicate is
evaluated, and, only if it returns false, is the costly pattern predicate evaluated.

**Query**

```cypher
MATCH (other:Person)
WHERE other.age > 25 OR (other)-[:FRIENDS_WITH]->(:Person)
RETURN other.name
```

**27.3.34. Select Or Anti Semi Apply**

The `SelectOrAntiSemiApply` operator is used to evaluate OR between a predicate and a negative pattern predicate (i.e. a pattern predicate preceded with NOT), and is a variation of the Apply operator. If the predicate returns true, the pattern predicate is not tested. If the predicate returns false or null, `SelectOrAntiSemiApply` will instead test the pattern predicate.
MATCH (other:Person)
WHERE other.age > 25 OR NOT (other)-[:FRIENDS_WITH]->(:Person)
RETURN other.name

27.3.35. Let Select Or Semi Apply

The `LetSelectOrSemiApply` operator is planned for pattern predicates that are combined with other predicates using OR. This is a variation of the `Apply` operator.
Query

```
CYPHER runtime=slotted
MATCH (other:Person)
WHERE (other)-[:FRIENDS_WITH]->(:Person) OR (other)-[:WORKS_IN]->(:Location) OR other.age = 5
RETURN other.name
```

Total database accesses: 172, total allocated memory: 64
```
27.3.36. Let Select Or Anti Semi Apply

The `LetSelectOrAntiSemiApply` operator is planned for negated pattern predicates — i.e. pattern predicates preceded with `NOT` — that are combined with other predicates using `OR`. This operator is a variation of the `Apply` operator.

Query

```cypher
cypher runtime=slotted
match (other:Person)
where not (other)-[:FRIENDS_WITH]-(:Person) or (other)-[:WORKS_IN]-(:Location) or other.age = 5
return other.name
```
### 27.3.37. Merge

The **Merge** operator will either read or create nodes and/or relationships.

If matches are found it will execute the provided **ON MATCH** operations foreach incoming row. If no matches
are found instead nodes and relationships are created and all ON CREATE operations are run.

Query

```cypher
MERGE (p:Person {name: 'Andy'})
ON MATCH SET p.existed = true
ON CREATE SET p.existed = false
```

Query Plan

```

| +NodeIndexSeek  | p:Person(name) WHERE name = $autostring_0                                         |
| 1 | 1 | 2 | 72 | 2/1 | 2.292 | Fused in Pipeline 0 |

Total database accesses: 3, total allocated memory: 136

27.3.38. Locking Merge

The LockingMerge operator is just like a normal Merge but will lock the start and end node when creating a relationship if necessary.

Query

```cypher
MATCH (s:Person {name: 'me'}) MERGE (s)-[:FRIENDS_WITH]->(s)
```
### 27.3.39. Roll Up Apply

The **RollUpApply** operator is used to execute an expression which takes as input a pattern, and returns a list with content from the matched pattern; for example, when using a pattern expression or pattern comprehension in a query. This operator is a variation of the **Apply** operator.

**Query**

```cypher
cYPHER runtime=slotted
MATCH (p:Person)
RETURN p.name, [(p)-[:WORKS_IN]->(location) | location.name] AS cities
```
### 27.3.40. Argument

The **Argument** operator indicates the variable to be used as an argument to the right-hand side of an **Apply** operator.

**Query**

```
MATCH (s:Person {name: 'me'}) MERGE (s)-[:FRIENDS_WITH]->(s)
```
27.3.41. Expand All

Given a start node, and depending on the pattern relationship, the **Expand(All)** operator will traverse incoming or outgoing relationships.

**Query**

```
MATCH (p:Person {name: 'me'})-[[:FRIENDS_WITH]->(fof) RETURN fof
```
### 27.3.42. Expand Into

When both the start and end node have already been found, the `Expand(Into)` operator is used to find all relationships connecting the two nodes. As both the start and end node of the relationship are already in scope, the node with the smallest degree will be used. This can make a noticeable difference when dense nodes appear as end points.

**Query**

```
MATCH (p:Person {name: 'me'})-[[:FRIENDS_WITH]->(fof)]->(p) RETURN fof
```

+----------------+------------------------+-----------+---------------------+--------
| +NodeIndexSeek  | p:Person(name) WHERE name = $autostring_0 | 1           | 1     | 2       | 72              | 2/1                    | 0.682     |                     |
 Total database accesses: 5, total allocated memory: 152

27.3.43. Optional Expand All

The OptionalExpand(All) operator is analogous to Expand(All), apart from when no relationships match the direction, type and property predicates. In this situation, OptionalExpand(all) will return a single row with the relationship and end node set to null.

Query

```
MATCH (p:Person)
    OPTIONAL MATCH (p)-[works_in:WORKS_IN]->(l) WHERE works_in.duration > 180
RETURN p, l
```
27.3.44. Optional Expand Into

The OptionalExpand(Into) operator is analogous to Expand(Into), apart from when no matching relationships are found. In this situation, OptionalExpand(Into) will return a single row with the relationship and end node set to null. As both the start and end node of the relationship are already in scope, the node with the smallest degree will be used. This can make a noticeable difference when dense nodes appear as end points.

Query

```
MATCH (p:Person)-[works_in:WORKS_IN]->(l) OPTIONAL MATCH (l)<-(p) RETURN p
```
27.3.45. VarLength Expand All

Given a start node, the VarLengthExpand(All) operator will traverse variable-length relationships.

Query

```
MATCH (p:Person)-[:FRIENDS_WITH *1..2]-(q:Person) RETURN p, q
```
### 27.3.46. VarLength Expand Into

When both the start and end node have already been found, the `VarLengthExpand(Into)` operator is used to find all variable-length relationships connecting the two nodes.

**Query**

```cypher
MATCH (p:Person)-[:FRIENDS_WITH *1..2]-(p:Person) RETURN p
```
27.3.47. VarLength Expand Pruning

Given a start node, the \texttt{VarLengthExpand(Pruning)} operator will traverse variable-length relationships much like the \texttt{VarLengthExpand(All)} operator. However, as an optimization, some paths will not be explored if they are guaranteed to produce an end node that has already been found (by means of a previous path traversal). This will only be used in cases where the individual paths are not of interest. This operator guarantees that all the end nodes produced will be unique.

Query

\begin{verbatim}
MATCH (p:Person)-[:FRIENDS_WITH *3..4]-(q:Person) RETURN DISTINCT p, q
\end{verbatim}
27.3.48. Assert Same Node

The AssertSameNode operator is used to ensure that no unique constraints are violated in the slotted and interpreted runtime. The example looks for the presence of a team with the supplied name and id, and if one does not exist, it will be created. Owing to the existence of two unique constraints on :Team(name) and :Team(id), any node that would be found by the UniqueIndexSeek must be the very same node, or the constraints would be violated.

Query

```
CYPHER runtime=slotted MERGE (t:Team {name: 'Engineering', id: 42})
```
27.3.49. Empty Result

The `EmptyResult` operator eagerly loads all incoming data and discards it.

Query

```
CREATE (:Person)
```
27.3.50. Produce Results

The **ProduceResults** operator prepares the result so that it is consumable by the user, such as transforming internal values to user values. It is present in every single query that returns data to the user, and has little bearing on performance optimisation.

**Query**

```
MATCH (n) RETURN n
```
27.3.51. Load CSV

The **LoadCSV** operator loads data from a CSV source into the query. It is used whenever the **LOAD CSV** clause is used in a query.

**Query**

```cypher
LOAD CSV FROM 'https://neo4j.com/docs/cypher-refcard/3.3/csv/artists.csv' AS line RETURN line
```

**Query Plan**

Total database accesses: 0, total allocated memory: 136

27.3.52. Hash joins in general

Hash joins have two inputs: the build input and probe input. The query planner assigns these roles so that the smaller of the two inputs is the build input. The build input is pulled in eagerly, and is used to build a probe table. Once this is complete, the probe table is checked for each row coming from the probe input side.

In query plans, the build input is always the left operator, and the probe input the right operator.

There are four hash join operators:

- **NodeHashJoin**
- **ValueHashJoin**
- **NodeLeftOuterHashJoin**
- **NodeRightOuterHashJoin**

27.3.53. Node Hash Join

The **NodeHashJoin** operator is a variation of the hash join. **NodeHashJoin** executes the hash join on node ids. As primitive types and arrays can be used, it can be done very efficiently.
27.3.54. Value Hash Join

The **ValueHashJoin** operator is a variation of the hash join. This operator allows for arbitrary values to be used as the join key. It is most frequently used to solve predicates of the form: \( n.\text{prop1} = m.\text{prop2} \) (i.e. equality predicates between two property columns).

**Query**

```
MATCH (p:Person), (q:Person)
WHERE p.age = q.age
RETURN p, q
```

---

### 27.3.55. Node Left/Right Outer Hash Join

The `NodeLeftOuterHashJoin` and `NodeRightOuterHashJoin` operators are variations of the hash join. The query below can be planned with either a left or a right outer join. The decision depends on the cardinalities of the left-hand and right-hand sides; i.e. how many rows would be returned, respectively, for \((a:Person)\) and \((a)\rightarrow(b:Person)\). If \((a:Person)\) returns fewer results than \((a)\rightarrow(b:Person)\), a left outer join — indicated by `NodeLeftOuterHashJoin` — is planned. On the other hand, if \((a:Person)\) returns more results than \((a)\rightarrow(b:Person)\), a right outer join — indicated by `NodeRightOuterHashJoin` — is planned instead.

**Query**

```
MATCH (a:Person)
OPTIONAL MATCH (a)--> (b:Person)
USING JOIN ON a
RETURN a.name, b.name
```
27.3.56. Triadic Selection

The `TriadicSelection` operator is used to solve triangular queries, such as the very common 'find my friend-of-friends that are not already my friend'. It does so by putting all the friends into a set, and uses the set to check if the friend-of-friends are already connected to me. The example finds the names of all friends of my friends that are not already my friends.

**Query**

```
MATCH (me:Person)-[:FRIENDS_WITH]-(anon_0)-[:FRIENDS_WITH]-(other)
WHERE NOT (me)-[:FRIENDS_WITH]-(other)
RETURN other.name
```
27.3.57. Triadic Build

The TriadicBuild operator is used in conjunction with TriadicFilter to solve triangular queries, such as the very common 'find my friend-of-friends that are not already my friend'. These two operators are specific to Pipelined runtime and together perform the same logic as TriadicSelection does for other runtimes. TriadicBuild builds a set of all friends, which is later used by TriadicFilter. The example finds the names of all friends of my friends that are not already my friends.

Query

```
MATCH (me:Person)-[:FRIENDS_WITH]-()-[[:FRIENDS_WITH]]-(other)
WHERE NOT (me)-[:FRIENDS_WITH]-()-[[:FRIENDS_WITH]]-(other)
RETURN other.name
```

27.3.59. Cartesian Product

The `CartesianProduct` operator produces a cartesian product of the two inputs — each row coming from the left child operator will be combined with all the rows from the right child operator. `CartesianProduct` generally exhibits bad performance and ought to be avoided if possible.

**Query**

```
MATCH (p:Person), (t:Team) RETURN p, t
```

27.3.60. Foreach

The `Foreach` operator executes a nested loop between the left child operator and the right child operator. In an analogous manner to the `Apply` operator, it takes a row from the left-hand side and, using the `Argument` operator, provides it to the operator tree on the right-hand side. `Foreach` will yield all the rows coming in from the left-hand side; all results from the right-hand side are pulled in and discarded.

Total database accesses: 9, total allocated memory: 64

27.3.61. Eager

For isolation purposes, the `Eager` operator ensures that operations affecting subsequent operations are executed fully for the whole dataset before continuing execution. Information from the stores is fetched in a lazy manner; i.e. the pattern matching might not be fully exhausted before updates are applied. To guarantee reasonable semantics, the query planner will insert `Eager` operators into the query plan to prevent updates from influencing pattern matching; this scenario is exemplified by the query below, where the `DELETE` clause influences the `MATCH` clause. The `Eager` operator can cause high memory usage when importing data or migrating graph structures. In such cases, the operations should be split into simpler steps; e.g. importing nodes and relationships separately. Alternatively, the records to be updated can be returned, followed by an update statement.

Query

```
MATCH (a)-[r]-(b) DELETE r,a,b MERGE ()
```
### 27.3.62. Eager Aggregation

The `EagerAggregation` operator evaluates a grouping expression and uses the result to group rows into different groupings. For each of these groupings, `EagerAggregation` will then evaluate all aggregation functions and return the result. To do this, `EagerAggregation`, as the name implies, needs to pull in all data.
eagerly from its source and build up state, which leads to increased memory pressure in the system.

**Query**

```cypher
MATCH (l:Location)<-[::WORKS_IN]-(p:Person) RETURN l.name AS location, collect(p.name) AS people
```

**Query Plan**

```

### 27.3.64. Node Count From Count Store

The **NodeCountFromCountStore** operator uses the count store to answer questions about node counts. This is much faster than the **EagerAggregation** operator which achieves the same result by actually counting. However, as the count store only stores a limited range of combinations, **EagerAggregation** will still be used for more complex queries. For example, we can get counts for all nodes, and nodes with a label, but not nodes with more than one label.

**Query**

```cypher
MATCH (p:Person) RETURN count(p) AS people
```
27.3.65. Relationship Count From Count Store

The `RelationshipCountFromCountStore` operator uses the count store to answer questions about relationship counts. This is much faster than the `EagerAggregation` operator which achieves the same result by actually counting. However, as the count store only stores a limited range of combinations, `EagerAggregation` will still be used for more complex queries. For example, we can get counts for all relationships, relationships with a type, relationships with a label on one end, but not relationships with labels on both end nodes.

Query

---

### 27.3.71. Sort

The **Sort** operator sorts rows by a provided key. In order to sort the data, all data from the source operator needs to be pulled in eagerly and kept in the query state, which will lead to increased memory pressure in the system.

**Query**

```
MATCH (p:Person) RETURN p ORDER BY p.name
```
Query Plan

27.3.72. Partial Sort

The PartialSort operator is an optimization of the Sort operator that takes advantage of the ordering of the incoming rows. This operator uses lazy evaluation and has a lower memory pressure in the system than the Sort operator. Partial sort is only applicable when sorting on multiple columns.

Query

MATCH (p:Person) WHERE p.name STARTS WITH 'P' RETURN p ORDER BY p.name, p.age

Total database accesses: 50, total allocated memory: 152

### 27.3.78. Optional

The **Optional** operator is used to solve some **OPTIONAL MATCH** queries. It will pull data from its source, simply passing it through if any data exists. However, if no data is returned by its source, **Optional** will yield a single row with all columns set to **null**.

**Query**

```
MATCH (p:Person {name:'me'}) OPTIONAL MATCH (q:Person {name: 'Lulu'}) RETURN p, q
```
# Query Plan

Total database accesses: ?, total allocated memory: 592

27.3.84. Cache Properties

The CacheProperties operator reads nodes and relationship properties and caches them in the current row. Future accesses to these properties can avoid reading from the store which will speed up the query. In the plan below we will cache `l.name` before Expand(All) where there are fewer rows.

Query

MATCH (l:Location)<-[:WORKS_IN]-:(p:Person) RETURN l.name AS location, p.name AS name
### 27.3.85. Create Nodes / Relationships

The **Create** operator is used to create nodes and relationships.

**Query**

```cypher
CREATE (max:Person {name: 'Max'}), (chris:Person {name: 'Chris'})
CREATE (max)-[:FRIENDS_WITH]->(chris)
```
27.3.86. Delete

The **Delete** operator is used to delete a node or a relationship.

**Query**

```
MATCH (me:Person {name: 'me'})-[w:WORKS_IN {duration: 190}]->(london:Location {name: 'London'})
DELETE w
```
27.3.87. Detach Delete

The **DetachDelete** operator is used in all queries containing the **DETACH DELETE** clause, when deleting nodes and their relationships.

**Query**

```
MATCH (p:Person)
DETACH DELETE p
```

## 27.3.91. Set Relationship Properties From Map

The `SetRelationshipPropertiesFromMap` operator is used when setting properties from a map on a relationship.

**Query**

```cypher
MATCH (n)-[r]->(m)  
SET r = {weight: 5, unit: 'kg'}
```
27.3.92. Set Property

The **SetProperty** operator is used when setting a property on a node or relationship.

**Query**

```cypher
MATCH (n)
SET n.checked = true
```
27.3.93. Create Unique Constraint

The CreateUniqueConstraint operator creates a unique constraint on a property for all nodes having a certain label. The following query will create a unique constraint with the name uniqueness on the name property of nodes with the Country label.

Query

```
CREATE CONSTRAINT uniqueness ON (c:Country) ASSERT c.name is UNIQUE
```

Query Plan

Compiler CYPHER 4.3
Planner ADMINISTRATION
Runtime SCHEMA
Runtime version 4.3

```
+-----------------+----------------------------------------------------------------+
| Operator          | Details                                                        |

+-----------------+-----------------------------------------------------+
Total database accesses: ?
```

27.3.95. Create Constraint only if it does not already exist

To not get an error creating the same constraint twice, we use the `DoNothingIfExists` operator for constraints. This will make sure no other constraint with the given name or another constraint of the same type and schema already exists before the specific `CreateConstraint` operator creates the constraint. If it finds a constraint with the given name or with the same type and schema it will stop the execution and no new constraint is created. The following query will create a unique constraint with the name `uniqueness` on the `name` property of nodes with the `Country` label only if no constraint named `uniqueness` or unique constraint on `(:Country {name})` already exists.

**Query**

```
CREATE CONSTRAINT uniqueness IF NOT EXISTS ON (c:Country) ASSERT c.name is UNIQUE
```
27.3.96. Create Node Property Existence Constraint

The `CREATE CONSTRAINT` operator creates an existence constraint with the name `existence` on a property for all nodes having a certain label. This will only appear in Enterprise Edition.

**Query**

```cypher
CREATE CONSTRAINT existence ON (p:Person) ASSERT p.name IS NOT NULL
```

**Query Plan**

```
+--------------------------------+----------------------------------------------------------------+
| Operator                       | Details                                                        |

```

Total database accesses: ?

27.3.97. Drop Node Property Existence Constraint == Deprecated

The `DROP CONSTRAINT` operator removes an existence constraint from a property for all nodes having a certain label. This will only appear in Enterprise Edition.

**Query**

```cypher
DROP CONSTRAINT ON (p:Person) ASSERT exists(p.name)
```

**Query Plan**

```
+--------------------------------+----------------------------------------------------------------+
| Operator                       | Details                                                        |
+--------------------------------+----------------------------------------------------------------+
| +CreateConstraint              | CONSTRAINT existence ON (p:Person) ASSERT (p.name) IS NOT NULL  |
+--------------------------------+----------------------------------------------------------------+
```

Total database accesses: ?
27.3.98. Create Node Key Constraint

The `CreateNodeKeyConstraint` operator creates a node key constraint with the name `node_key` which ensures that all nodes with a particular label have a set of defined properties whose combined value is unique, and where all properties in the set are present. This will only appear in Enterprise Edition.

**Query**

```
CREATE CONSTRAINT node_key ON (e:Employee) ASSERT (e.firstname, e.surname) IS NODE KEY
```

**Query Plan**

<table>
<thead>
<tr>
<th>Operator</th>
<th>Details</th>
</tr>

</tr>
</thead>
<tbody>
<tr>
<td>-DropConstraint</td>
<td>CONSTRAINT ON (p:Person) ASSERT exists(p.name)</td>
</tr>
</tbody>
</table>
27.3.100. Create Relationship Property Existence Constraint

The **CreateRelationshipPropertyExistenceConstraint** operator creates an existence constraint with the name `existence` on a property for all relationships of a certain type. This will only appear in Enterprise Edition.

Query

```cypher
CREATE CONSTRAINT existence ON ()-[l:LIKED]-() ASSERT l.when IS NOT NULL
```

27.3.101. Drop Relationship Property Existence Constraint == **Deprecated**

The **DropRelationshipPropertyExistenceConstraint** operator removes an existence constraint from a property for all relationships of a certain type. This will only appear in Enterprise Edition.

Query

```cypher
DROP CONSTRAINT ON ()-[l:LIKED]-() ASSERT exists(l.when)
```
27.3.102. Drop Constraint by name

The **DropConstraint** operator removes a constraint using the name of the constraint, no matter the type.

**Query**

```cypher
DROP CONSTRAINT name
```

**Query Plan**

```
Compiler CYPHER 4.3
Planner ADMINISTRATION

</tr>
</thead>
<tbody>
<tr>
<td>+DropConstraint</td>
<td>CONSTRAINT ON ()-[l:LIKED]-() ASSERT exists(l.when)</td>
</tr>
</tbody>
</table>

Total database accesses: ?
```

27.3.103. Listing constraints

The **ShowConstraints** operator lists constraints. It may include filtering on constraint type and can have either default or full output.

**Query**

```cypher
SHOW CONSTRAINTS
```
### 27.3.104. Create Index

The **CreateIndex** operator creates an index. This index can either be a b-tree, fulltext, or token lookup index. The following query will create an index with the name `my_index` on the `name` property of nodes with the `Country` label.

**Query**

```cypher
CREATE INDEX my_index FOR (c:Country) ON (c.name)
```

**Query Plan**

<table>
<thead>
<tr>
<th>Operator</th>
<th>Details</th>
<th>Estimated Rows</th>
</tr>
</thead>
<tbody>
<tr>
<td>+ProduceResults</td>
<td>id, name, type, entityType, labelsOrTypes, properties, ownedIndexId</td>
<td>10</td>
</tr>
<tr>
<td></td>
<td>Rows</td>
<td>DB Hits</td>
</tr>
</tbody>
</table>

Total database accesses: 1, total allocated memory: 64

### 27.3.105. Create Index only if it does not already exist

To not get an error creating the same index twice, we use the **DoNothingIfExists** operator for indexes. This will make sure no other index with the given name or schema already exists before the **CreateIndex** operator creates an index. If it finds an index with the given name or schema it will stop the execution and no new index is created. The following query will create an index with the name `my_index` on the `since` property of relationships with the `KNOWS` relationship type only if no such index already exists.

**Query**

```cypher
CREATE INDEX IF NOT EXISTS my_index FOR (:Country)-[:KNOWS]->():Country ON (c.since)
```

**Query Plan**

<table>
<thead>
<tr>
<th>Operator</th>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td>+CreateIndex</td>
<td>INDEX my_index FOR (:Country)-[:KNOWS]-&gt;():Country</td>
</tr>
</tbody>
</table>

Total database accesses: ?
Query

```cypher
CREATE INDEX my_index IF NOT EXISTS FOR ()-[k:KNOWS]-() ON (k.since)
```

Query Plan

<table>
<thead>
<tr>
<th>Operator</th>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td>+CreateIndex</td>
<td>INDEX my_index FOR ()-[k:KNOWS]-() ON (since)</td>
</tr>
<tr>
<td>+DoNothingIfExists(INDEX)</td>
<td>INDEX my_index FOR ()-[k:KNOWS]-() ON (since)</td>
</tr>
</tbody>
</table>

Total database accesses: ?

### 27.3.106. Drop Index by schema

The `DropIndex` operator removes an index from a property for all nodes having a certain label. The following query will drop an index on the `name` property of nodes with the `Country` label.

**Query**

```cypher
DROP INDEX ON :Country(name)
```

**Query Plan**

<table>
<thead>
<tr>
<th>Operator</th>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td>+DropIndex</td>
<td>INDEX FOR (:Country) ON (name)</td>
</tr>
</tbody>
</table>

Total database accesses: ?

### 27.3.107. Drop Index by name

The `DropIndex` operator removes an index using the name of the index.

**Query**

```cypher
DROP INDEX name
```
27.3.108. Listing indexes

The `ShowIndexes` operator lists indexes. It may include filtering on index type and can have either default or full output.

Query

```
SHOW INDEXES
```

27.3.109. Listing functions

The `ShowFunctions` operator lists functions. It may include filtering on built-in vs user-defined functions as well as if a given user can execute the function. The output can either be default or full output.
27.3.110. Listing procedures

The `ShowProcedures` operator lists procedures. It may include filtering on whether a given user can execute the procedure and can have either default or full output.
27.4. Shortest path planning

Shortest path finding in Cypher and how it is planned.

Planning shortest paths in Cypher can lead to different query plans depending on the predicates that need to be evaluated. Internally, Neo4j will use a fast bidirectional breadth-first search algorithm if the predicates can be evaluated whilst searching for the path. Therefore, this fast algorithm will always be certain to return the right answer when there are universal predicates on the path; for example, when searching for the shortest path where all nodes have the Person label, or where there are no nodes with a name property.

If the predicates need to inspect the whole path before deciding on whether it is valid or not, this fast algorithm cannot be relied on to find the shortest path, and Neo4j may have to resort to using a slower exhaustive depth-first search algorithm to find the path. This means that query plans for shortest path queries with non-universal predicates will include a fallback to running the exhaustive search to find the path should the fast algorithm not succeed. For example, depending on the data, an answer to a shortest path query with existential predicates — such as the requirement that at least one node contains the property name='Kevin Bacon' — may not be able to be found by the fast algorithm. In this case, Neo4j will fall back to using the exhaustive search to enumerate all paths and potentially return an answer.

The running times of these two algorithms may differ by orders of magnitude, so it is important to ensure that the fast approach is used for time-critical queries.

When the exhaustive search is planned, it is still only executed when the fast algorithm fails to find any matching paths. The fast algorithm is always executed first, since it is possible that it can find a valid path even though that could not be guaranteed at planning time.

Please note that falling back to the exhaustive search may prove to be a very time consuming strategy in some cases; such as when there is no shortest path between two nodes. Therefore, in these cases, it is recommended to set cypher.forbid_exhaustive_shortestpath to true, as explained in Operations Manual → Configuration settings

27.4.1. Shortest path with fast algorithm

Query

MATCH (KevinB:Person {name: 'Kevin Bacon'}), (Al:Person {name: 'Al Pacino'}),
    p = shortestPath((KevinB)-[:ACTED_IN*]-(Al))
WHERE all(r IN relationships(p) WHERE r.role IS NOT NULL)
RETURN p

This query can be evaluated with the fast algorithm — there are no predicates that need to see the whole path before being evaluated.
### 27.4.2. Shortest path with additional predicate checks on the paths

Consider using the exhaustive search as a fallback

Predicates used in the `WHERE` clause that apply to the shortest path pattern are evaluated before deciding what the shortest matching path is.

**Query**

```cypher
MATCH (KevinB:Person {name: 'Kevin Bacon'}),
     (Al:Person {name: 'Al Pacino'}),
WHERE p = shortestPath((KevinB)-[*]-(%1))
RETURN length(p) > 1
```

This query, in contrast with the one above, needs to check that the whole path follows the predicate before we know if it is valid or not, and so the query plan will also include the fallback to the slower exhaustive search algorithm.

**Query plan**

<td>(KevinB)-[anon_0*]-(Al)</td>
</tr>
<tr>
<td>+Argument</td>
<td>KevinB, Al</td>
</tr>
<tr>
<td>+Optional</td>
<td>KevinB, Al</td>
</tr>
</tbody>
</table>
The way the bigger exhaustive query plan works is by using `Apply/Optional` to ensure that when the fast algorithm does not find any results, a `null` result is generated instead of simply stopping the result stream. On top of this, the planner will issue an `AntiConditionalApply`, which will run the exhaustive search if the path variable is pointing to `null` instead of a path.

An `ErrorPlan` operator will appear in the execution plan in cases where (i) `cypher.forbid_exhaustive_shortestpath` is set to `true`, and (ii) the fast algorithm is not able to find the shortest path.

Prevent the exhaustive search from being used as a fallback

Query

```
MATCH (KevinB:Person {name: 'Kevin Bacon'}),
      (Al:Person {name: 'Al Pacino'}),
WITH p = shortestPath((KevinB)-[*]-(Al))
WHERE length(p) > 1
RETURN p
```

This query, just like the one above, needs to check that the whole path follows the predicate before we know if it is valid or not. However, the inclusion of the `WITH` clause means that the query plan will not include the fallback to the slower exhaustive search algorithm. Instead, any paths found by the fast algorithm will subsequently be filtered, which may result in no answers being returned.

<tr>
<td>Syntax [Deprecated]</td>
<td>Replaced by:</td>
</tr>
<tr>
<td>ON DEFAULT GRAPH</td>
<td>ON HOME GRAPH</td>
</tr>
</tbody>
</table>
### Syntax Deprecated

**MATCH (a) RETURN (a)--()**

Pattern expressions producing lists of paths are deprecated, but they can still be used as existence predicates, for example in `WHERE` clauses. Instead, use a pattern comprehension:

**MATCH (a) RETURN [p=(a)--() | p]**

### 28.1.2. Updated features

<table>

</tbody>
</table>

| Functionality Updated | Now allows easy filtering for `SHOW INDEXES` on fulltext indexes. Allows `YIELD` and `WHERE` but not `BRIEF` or `VERBOSE`.                                                                                     |

| Functionality Updated | Now allows easy filtering for `SHOW INDEXES` on token lookup indexes. Allows `YIELD` and `WHERE` but not `BRIEF` or `VERBOSE`.                                                                                     |

---

### 28.1.3. New features

<table>
<thead>
<tr>
<th>Feature</th>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td>Syntax New</td>
<td>New syntax to pass options to <code>CREATE DATABASE</code>. This can be used to specify a specific cluster node to seed data from.</td>
</tr>
</tbody>
</table>

```
CREATE DATABASE ... [OPTIONS {...}]
```

| Syntax New    | New syntax for creating node property existence constraints.                                                                                                                                              |

```
CREATE CONSTRAINT [name] ON (node:Label) ASSERT node.property IS NOT NULL
```

| Syntax New    | New syntax for creating relationship property existence constraints.                                                                                                                                     |

```
CREATE CONSTRAINT [name] ON ()-[rel:REL]()-() ASSERT rel.property IS NOT NULL
```

| Syntax New    | Makes altering users idempotent. If the specified name does not exists, no error is thrown.                                                                                                              |

```
ALTER USER name IF EXISTS ...
```
<table>

<td><strong>New</strong></td>
</tr>
<tr>
<td>SHOW CONSTRAINT</td>
<td>New Cypher command for administering privilege for listing constraints.</td>
</tr>
</tbody>
</table>

**Syntax**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>New</th>
</tr>
</thead>
<tbody>
<tr>
<td>CREATE INDEX [name] IF NOT EXISTS FOR ...</td>
<td>Makes index creation idempotent. If an index with the name or schema already exists no error will be thrown.</td>
</tr>
<tr>
<td>DROP INDEX name IF EXISTS</td>
<td>Makes index deletion idempotent. If no index with the name exists no error will be thrown.</td>
</tr>
<tr>
<td>CREATE CONSTRAINT [name] IF NOT EXISTS ON ...</td>
<td>Makes constraint creation idempotent. If a constraint with the name or type and schema already exists no error will be thrown.</td>
</tr>
<tr>
<td>DROP CONSTRAINT name IF EXISTS</td>
<td>Makes constraint deletion idempotent. If no constraint with the name exists no error will be thrown.</td>
</tr>
</tbody>
</table>
## 28.4. Version 4.1

### 28.4.1. Restricted features

<table>
<thead>
<tr>
<th>Feature</th>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td>Functionality <strong>Restricted</strong></td>
<td>No longer revokes sub-privileges when revoking a compound privilege, e.g. when revoking <code>INDEX MANAGEMENT</code>, any <code>CREATE INDEX</code> and <code>DROP INDEX</code> privileges will no longer be revoked.</td>
</tr>
<tr>
<td>REVOKE ...</td>
<td></td>
</tr>
<tr>
<td><strong>Functionality</strong> <strong>Restricted</strong></td>
<td>No longer includes the privileges <code>START DATABASE</code> and <code>STOP DATABASE</code>.</td>
</tr>
<tr>
<td>ALL DATABASE PRIVILEGES</td>
<td></td>
</tr>
</tbody>
</table>

### 28.4.2. Updated features

<table>
<thead>
<tr>
<th>Feature</th>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td>Procedure <strong>Updated</strong></td>
<td>The <code>queryId</code> procedure format has changed, and no longer includes the database name. For example, <code>mydb-query-123</code> is now <code>query-123</code>. This change affects built-in procedures <code>dbms.listQueries()</code>, <code>dbms.listActiveLocks(queryId)</code>, <code>dbms.killQueries(queryIds)</code> and <code>dbms.killQuery(queryId)</code>.</td>
</tr>
<tr>
<td>queryId</td>
<td></td>
</tr>
<tr>
<td><strong>Functionality</strong> <strong>Updated</strong></td>
<td>The returned privileges are a closer match to the original grants and denies, e.g. if granted <code>MATCH</code> the command will show that specific privilege and not the <code>TRAVERSE</code> and <code>READ</code> privileges. Added support for <code>YIELD</code> and <code>WHERE</code> clauses to allow filtering results.</td>
</tr>
<tr>
<td>SHOW PRIVILEGES</td>
<td></td>
</tr>
</tbody>
</table>

### 28.4.3. New features

<td>Deprecated</td>
</tr>
<tr>
<td>DROP CONSTRAINT ON ()-[r:Type]-() ASSERT exists (r.prop)</td>
<td>Replaced by DROP CONSTRAINT name.</td>
</tr>
</tbody>
</table>

## 28.5.3. Restricted features
<table>
<thead>
<tr>
<th>Feature</th>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Function</strong></td>
<td><strong>Restricted</strong></td>
</tr>
<tr>
<td>length()</td>
<td>Restricted to only work on paths. See <code>length()</code> for more details.</td>
</tr>
<tr>
<td><strong>Function</strong></td>
<td><strong>Restricted</strong></td>
</tr>
<tr>
<td>size()</td>
<td>No longer works for paths. Only works for strings, lists and pattern expressions. See <code>size()</code> for more details.</td>
</tr>
</tbody>
</table>

### 28.5.4. Updated features

<table>
<thead>
<tr>
<th>Feature</th>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Syntax</strong></td>
<td><strong>Extended</strong></td>
</tr>
<tr>
<td>CREATE CONSTRAINT [name] ON ...</td>
<td>The create constraint syntax can now include a name.</td>
</tr>
</tbody>
</table>

### 28.5.5. New features

<table>
<thead>
<tr>
<th>Feature</th>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Functionality</strong></td>
<td><strong>New</strong></td>
</tr>
<tr>
<td>Pipelined runtime:</td>
<td>This Neo4j Enterprise Edition only feature involves a new runtime that has many performance enhancements.</td>
</tr>
<tr>
<td>CYPHER runtime=pipelined</td>
<td></td>
</tr>
<tr>
<td><strong>Functionality</strong></td>
<td><strong>New</strong></td>
</tr>
<tr>
<td>Multi-database administration</td>
<td>New Cypher commands for administering multiple databases.</td>
</tr>
<tr>
<td><strong>Functionality</strong></td>
<td><strong>New</strong></td>
</tr>
<tr>
<td>Access control</td>
<td>New Cypher commands for administering role-based access control.</td>
</tr>
<tr>
<td><strong>Functionality</strong></td>
<td><strong>New</strong></td>
</tr>
<tr>
<td>Fine-grained security</td>
<td>New Cypher commands for administering dbms, database, graph and sub-graph access control.</td>
</tr>
<tr>
<td><strong>Syntax</strong></td>
<td><strong>New</strong></td>
</tr>
<tr>
<td>CREATE INDEX [name] FOR (n:Label) ON (n.prop)</td>
<td>New syntax for creating indexes, which can include a name.</td>
</tr>
</tbody>
</table>
## 28.6. Version 3.5

### 28.6.1. Deprecated features

<table>
<thead>
<tr>
<th>Feature</th>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Function</strong></td>
<td><strong>Deprecated</strong></td>
</tr>
<tr>
<td>Compiled runtime:</td>
<td></td>
</tr>
<tr>
<td>CYPHER runtime=compiled</td>
<td>The compiled runtime will be discontinued in the next major release. It might still be used for default queries in order to not cause regressions, but explicitly requesting it will not be possible.</td>
</tr>
<tr>
<td><strong>Function</strong></td>
<td><strong>Deprecated</strong></td>
</tr>
<tr>
<td>extract()</td>
<td>Replaced by list comprehension.</td>
</tr>
<tr>
<td><strong>Function</strong></td>
<td><strong>Deprecated</strong></td>
</tr>
<tr>
<td>filter()</td>
<td>Replaced by list comprehension.</td>
</tr>
</tbody>
</table>

## 28.7. Version 3.4
<table>
<thead>
<tr>
<th>Feature</th>
<th>Type</th>
<th>Change</th>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Spatial point types</strong></td>
<td>Functionality</td>
<td>Amendment</td>
<td>A point — irrespective of which Coordinate Reference System is used — can be stored as a property and is able to be backed by an index. Prior to this, a point was a virtual property only.</td>
</tr>
<tr>
<td>point() - Cartesian 3D</td>
<td>Function</td>
<td>Added</td>
<td></td>
</tr>
<tr>
<td>point() - WGS 84 3D</td>
<td>Function</td>
<td>Added</td>
<td></td>
</tr>
<tr>
<td>randomUUID()</td>
<td>Function</td>
<td>Added</td>
<td></td>
</tr>
<tr>
<td><strong>Temporal types</strong></td>
<td>Functionality</td>
<td>Added</td>
<td>Supports storing, indexing and working with the following temporal types: Date, Time, LocalTime, DateTime, LocalDateTime and Duration.</td>
</tr>
<tr>
<td><strong>Temporal functions</strong></td>
<td>Functionality</td>
<td>Added</td>
<td>Functions allowing for the creation and manipulation of values for each temporal type — Date, Time, LocalTime, DateTime, LocalDateTime and Duration.</td>
</tr>
<tr>
<td><strong>Temporal operators</strong></td>
<td>Functionality</td>
<td>Added</td>
<td>Operators allowing for the manipulation of values for each temporal type — Date, Time, LocalTime, DateTime, LocalDateTime and Duration.</td>
</tr>
<tr>
<td>toString()</td>
<td>Function</td>
<td>Extended</td>
<td>Now also allows temporal values as input (i.e. values of type Date, Time, LocalTime, DateTime, LocalDateTime or Duration).</td>
</tr>
</tbody>
</table>

28.8. Version 3.3
<table>
<thead>
<tr>
<th>Feature</th>
<th>Type</th>
<th>Change</th>
<th>Details</th>
</tr>
</thead>
</table>
| START   | Clause | Removed | As in Cypher 3.2, any queries using the \texttt{START} clause will revert back to Cypher 3.1 \texttt{planner=rule}. However, there are built-in procedures for Neo4j versions 3.3 to 3.5 for accessing explicit indexes. The procedures will enable users to use the current version of Cypher and the cost planner together with these indexes. An example of this is \texttt{CALL db.index.explicit.searchNodes('my_index','email:me*')}.
| \texttt{CYPHER runtime=slotted} (Faster interpreted runtime) | Functionality | Added | Neo4j Enterprise Edition only |
| \texttt{max()}, \texttt{min()}} | Function | Extended | Now also supports aggregation over sets containing lists of strings and/or numbers, as well as over sets containing strings, numbers, and lists of strings and/or numbers |

### 28.9. Version 3.2

<table>
<thead>
<tr>
<th>Feature</th>
<th>Type</th>
<th>Change</th>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td>\texttt{CYPHER planner=rule} (Rule planner)</td>
<td>Functionality</td>
<td>Removed</td>
<td>All queries now use the cost planner. Any query prepended thus will fall back to using Cypher 3.1.</td>
</tr>
<tr>
<td>\texttt{CREATE UNIQUE}</td>
<td>Clause</td>
<td>Removed</td>
<td>Running such queries will fall back to using Cypher 3.1 (and use the rule planner)</td>
</tr>
<tr>
<td>START</td>
<td>Clause</td>
<td>Removed</td>
<td>Running such queries will fall back to using Cypher 3.1 (and use the rule planner)</td>

28.12. Compatibility

Neo4j’s ability to support multiple older versions of the Cypher language has changed over time. In versions prior to Neo4j 3.4, the backwards compatibility layer included the Cypher language parser, planner, and runtime. All supported versions of Cypher ran on the same Neo4j kernel. However, this changed in Neo4j 3.4 when the runtime was excluded from the compatibility layer. When you run, e.g. a CYPHER 3.1 query in Neo4j 3.5, the query is planned with the 3.1 planner, but run with 3.5 runtime and kernel. The compatibility layer changed again in Neo4j 4.0 and it now includes only the Cypher language parser. When you run a CYPHER 3.5 query, e.g., in Neo4j 4.3, Neo4j parses the older language features, but uses the 4.3 planner, runtime, and kernel to plan and run the query. The primary reason for these changes is the optimizations in the Cypher runtime to allow Cypher queries to perform better.

Older versions of the language can still be accessed if required. There are two ways to select which version to use in queries.

1. Setting a version for all queries: You can configure your database with the configuration parameter cypher.default_language_version, and enter which version you’d like to use (see Supported language versions). Every Cypher query will use this version, provided the query hasn’t explicitly been configured as described in the next item below.

2. Setting a version on a query by query basis: The other method is to set the version for a particular query. Prepending a query with CYPHER 3.5 will execute the query with the version of Cypher included in Neo4j 3.5.

Below is an example using the older parameter syntax (param):

```cypher
CYPHER 3.5
MATCH (n:Person)
WHERE n.age > {agelimit}
RETURN n.name, n.age
```

Without the CYPHER 3.5 prefix this query would fail with a syntax error. With CYPHER 3.5 however, it will only generate a warning and still work.
In Neo4j 4.3 the Cypher parser understands some older language features, even if they are no longer supported by the Neo4j kernel. These features result in runtime errors. See the table at Cypher Version 4.0 for the list of affected features.

28.13. Supported language versions

Neo4j 4.3 supports the following versions of the Cypher language:

- Neo4j Cypher 3.5
- Neo4j Cypher 4.2
- Neo4j Cypher 4.3

Each release of Neo4j supports a limited number of old Cypher Language Versions. When you upgrade to a new release of Neo4j, please make sure that it supports the Cypher language version you need. If not, you may need to modify your queries to work with a newer Cypher language version.
Chapter 29. Glossary of keywords

This section comprises a glossary of all the keywords — grouped by category and thence ordered lexicographically — in the Cypher query language.

- Clauses
- Operators
- Functions
- Expressions
- Cypher query options
- Administrative commands
- Privilege Actions

29.1. Clauses

<table>
<thead>
<tr>
<th>Clause</th>

### 29.3. Functions

<table>
<thead>
<tr>
<th>Function</th>
<th>Category</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>abs()</td>
<td>Numeric</td>
<td>Returns the absolute value of a number.</td>
</tr>
<tr>
<td>acos()</td>
<td>Trigonometric</td>
<td>Returns the arccosine of a number in radians.</td>
</tr>
<tr>
<td>all()</td>
<td>Predicate</td>
<td>Tests whether the predicate holds for all elements in a list.</td>
</tr>
<tr>
<td>any()</td>
<td>Predicate</td>
<td>Tests whether the predicate holds for at least one element in a list.</td>
</tr>
<tr>
<td>asin()</td>
<td>Trigonometric</td>
<td>Returns the arcsine of a number in radians.</td>
</tr>
<tr>
<td>atan()</td>
<td>Trigonometric</td>
<td>Returns the arctangent of a number in radians.</td>
</tr>
<tr>
<td>atan2()</td>
<td>Trigonometric</td>
<td>Returns the arctangent2 of a set of coordinates in radians.</td>
</tr>
<tr>
<td>avg()</td>
<td>Aggregating</td>
<td>Returns the average of a set of values.</td>
</tr>
<tr>
<td>ceil()</td>
<td>Numeric</td>
<td>Returns the smallest floating point number that is greater than or equal to a number and equal to a mathematical integer.</td>
</tr>
<tr>
<td>coalesce()</td>
<td>Scalar</td>
<td>Returns the first non-null value in a list of expressions.</td>
</tr>
<tr>
<td>collect()</td>
<td>Aggregating</td>
<td>Returns a list containing the values returned by an expression.</td>
</tr>
<tr>
<td>cos()</td>
<td>Trigonometric</td>
<td>Returns the cosine of a number.</td>
</tr>
<tr>
<td>cot()</td>
<td>Trigonometric</td>
<td>Returns the cotangent of a number.</td>
</tr>
<tr>
<td>count()</td>
<td>Aggregating</td>
<td>Returns the number of values or rows.</td>
</tr>
<tr>
<td>date()</td>
<td>Temporal</td>
<td>Returns the current Date.</td>
</tr>
<tr>
<td>date(year, month, day)</td>
<td>Temporal</td>
<td>Returns a calendar (Year-Month-Day) Date.</td>

<tr>
<td><code>datetime(year [, ordinalDay, ...])</code></td>
<td>Temporal</td>
<td>Returns an ordinal (Year-Day) DateTime.</td>
</tr>
<tr>
<td><code>datetime(string)</code></td>
<td>Temporal</td>
<td>Returns a DateTime by parsing a string.</td>
</tr>
<tr>
<td><code>datetime(map)</code></td>
<td>Temporal</td>
<td>Returns a DateTime from a map of another temporal value's components.</td>
</tr>
<tr>
<td><code>datetime(epochSeconds)</code></td>
<td>Temporal</td>
<td>Returns a DateTime from a timestamp.</td>
</tr>
<tr>
<td><code>datetime.realtime()</code></td>
<td>Temporal</td>
<td>Returns the current DateTime using the <code>realtime</code> clock.</td>
</tr>
<tr>
<td><code>datetime.statement()</code></td>
<td>Temporal</td>
<td>Returns the current DateTime using the <code>statement</code> clock.</td>
</tr>
<tr>
<td><code>datetime.transaction()</code></td>
<td>Temporal</td>
<td>Returns the current DateTime using the <code>transaction</code> clock.</td>
</tr>
<tr>
<td><code>datetime.truncate()</code></td>
<td>Temporal</td>
<td>Returns a DateTime obtained by truncating a value at a specific component boundary. Truncation summary.</td>
</tr>
<tr>
<td><code>degrees()</code></td>
<td>Trigonometric</td>
<td>Converts radians to degrees.</td>
</tr>
<tr>
<td><code>distance()</code></td>
<td>Spatial</td>
<td>Returns a floating point number representing the geodesic distance between any two points in the same CRS.</td>
</tr>
<tr>
<td><code>duration(map)</code></td>
<td>Temporal</td>
<td>Returns a Duration from a map of its components.</td>
</tr>
<tr>
<td>Function</td>
<td>Category</td>
<td>Description</td>
</tr>
<tr>
<td>------------------------</td>
<td>-------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>duration(string)</td>
<td>Temporal</td>
<td>Returns a Duration by parsing a string.</td>
</tr>
<tr>
<td>duration.between()</td>
<td>Temporal</td>
<td>Returns a Duration equal to the difference between two given instants.</td>
</tr>
<tr>
<td>duration.inDays()</td>
<td>Temporal</td>
<td>Returns a Duration equal to the difference in whole days or weeks between two given instants.</td>
</tr>
<tr>
<td>duration.inMonths()</td>
<td>Temporal</td>
<td>Returns a Duration equal to the difference in whole months, quarters or years between two given instants.</td>
</tr>
<tr>
<td>duration.inSeconds()</td>
<td>Temporal</td>
<td>Returns a Duration equal to the difference in seconds and fractions of seconds, or minutes or hours, between two given instants.</td>
</tr>
<tr>
<td>e()</td>
<td>Logarithmic</td>
<td>Returns the base of the natural logarithm, e.</td>
</tr>
<tr>
<td>endNode()</td>
<td>Scalar</td>
<td>Returns the end node of a relationship.</td>
</tr>
<tr>
<td>exists()</td>
<td>Predicate</td>
<td>Returns true if a match for the pattern exists in the graph, or if the specified property exists in the node, relationship or map.</td>
</tr>
<tr>
<td>exp()</td>
<td>Logarithmic</td>
<td>Returns $e^n$, where $e$ is the base of the natural logarithm, and $n$ is the value of the argument expression.</td>
</tr>
<tr>
<td>floor()</td>
<td>Numeric</td>
<td>Returns the largest floating point number that is less than or equal to a number and equal to a mathematical integer.</td>
</tr>
<tr>
<td>haversin()</td>
<td>Trigonometric</td>
<td>Returns half the versine of a number.</td>
</tr>
<tr>
<td>head()</td>
<td>Scalar</td>
<td>Returns the first element in a list.</td>
</tr>
<tr>
<td>id()</td>
<td>Scalar</td>
<td>Returns the id of a relationship or node.</td>
</tr>
<tr>
<td>isEmpty()</td>
<td>Predicate</td>
<td>Returns true if the given list or map contains no elements or if the given string contains no characters.</td>
</tr>
<tr>
<td>keys()</td>
<td>List</td>
<td>Returns a list containing the string representations for all the property names of a node, relationship, or map.</td>
</tr>
<tr>
<td>labels()</td>
<td>List</td>
<td>Returns a list containing the string representations for all the labels of a node.</td>
</tr>
<tr>
<td>last()</td>
<td>Scalar</td>
<td>Returns the last element in a list.</td>
</tr>
<tr>
<td>Function</td>
<td>Category</td>
<td>Description</td>
</tr>
<tr>
<td>--------------------------</td>
<td>-------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>left()</td>
<td>String</td>
<td>Returns a string containing the specified number of leftmost characters of the original string.</td>
</tr>
<tr>
<td>length()</td>
<td>Scalar</td>
<td>Returns the length of a path.</td>
</tr>
<tr>
<td>localdatetime()</td>
<td>Temporal</td>
<td>Returns the current LocalDateTime.</td>
</tr>
<tr>
<td>localdatetime((year [, month, day, ...]))</td>
<td>Temporal</td>
<td>Returns a calendar (Year-Month-Day) LocalDateTime.</td>
</tr>
<tr>
<td>localdatetime((year [, week, dayOfWeek, ...]))</td>
<td>Temporal</td>
<td>Returns a week (Year-Week-Day) LocalDateTime.</td>
</tr>
<tr>
<td>localdatetime((year [, quarter, dayOfQuarter, ...]))</td>
<td>Temporal</td>
<td>Returns a quarter (Year-Quarter-Day) DateTime.</td>
</tr>
<tr>
<td>localdatetime((year [, ordinalDay, ...]))</td>
<td>Temporal</td>
<td>Returns an ordinal (Year-Day) LocalDateTime.</td>
</tr>
<tr>
<td>localdatetime(string)</td>
<td>Temporal</td>
<td>Returns a LocalDateTime by parsing a string.</td>
</tr>
<tr>
<td>localdatetime((map))</td>
<td>Temporal</td>
<td>Returns a LocalDateTime from a map of another temporal value’s components.</td>
</tr>
<tr>
<td>localdatetime.realtime()</td>
<td>Temporal</td>
<td>Returns the current LocalDateTime using the realtime clock.</td>
</tr>
<tr>
<td>localdatetime.statement()</td>
<td>Temporal</td>
<td>Returns the current LocalDateTime using the statement clock.</td>
</tr>
<tr>
<td>localdatetime.transaction()</td>
<td>Temporal</td>
<td>Returns the current LocalDateTime using the transaction clock.</td>
</tr>
<tr>
<td>localdatetime.truncate()</td>
<td>Temporal</td>
<td>Returns a LocalDateTime obtained by truncating a value at a specific component boundary. Truncation summary.</td>
</tr>
<tr>
<td>localtime()</td>
<td>Temporal</td>
<td>Returns the current LocalTime.</td>
</tr>
<tr>
<td>localtime((hour [, minute, second, ...]))</td>
<td>Temporal</td>
<td>Returns a LocalTime with the specified component values.</td>
</tr>
<tr>
<td>localtime(string)</td>
<td>Temporal</td>
<td>Returns a LocalTime by parsing a string.</td>
</tr>
<tr>
<td>localtime((time [, hour, ...]))</td>
<td>Temporal</td>
<td>Returns a LocalTime from a map of another temporal value’s components.</td>
</tr>
<tr>
<td>localtime.realtime()</td>
<td>Temporal</td>
<td>Returns the current LocalTime using the realtime clock.</td>

<td>percentileCont()</td>
<td>Aggregating</td>
<td>Returns the percentile of the given value over a group using linear interpolation.</td>
</tr>
<tr>
<td>percentileDisc()</td>
<td>Aggregating</td>
<td>Returns the nearest value to the given percentile over a group using a rounding method.</td>
</tr>
<tr>
<td>pi()</td>
<td>Trigonometric</td>
<td>Returns the mathematical constant π.</td>
</tr>
<tr>
<td>point() - Cartesian 2D</td>
<td>Spatial</td>
<td>Returns a 2D point object, given two coordinate values in the Cartesian coordinate system.</td>
</tr>
<tr>
<td>point() - Cartesian 3D</td>
<td>Spatial</td>
<td>Returns a 3D point object, given three coordinate values in the Cartesian coordinate system.</td>
</tr>
<tr>
<td>point() - WGS 84 2D</td>
<td>Spatial</td>
<td>Returns a 2D point object, given two coordinate values in the WGS 84 coordinate system.</td>
</tr>
<tr>
<td>point() - WGS 84 3D</td>
<td>Spatial</td>
<td>Returns a 3D point object, given three coordinate values in the WGS 84 coordinate system.</td>
</tr>
<tr>
<td>properties()</td>
<td>Scalar</td>
<td>Returns a map containing all the properties of a node or relationship.</td>
</tr>
<tr>
<td>radians()</td>
<td>Trigonometric</td>
<td>Converts degrees to radians.</td>
</tr>
<tr>
<td>rand()</td>
<td>Numeric</td>
<td>Returns a random floating point number in the range from 0 (inclusive) to 1 (exclusive); i.e. [0, 1).</td>
</tr>
<tr>
<td>Function</td>
<td>Category</td>
<td>Description</td>
</tr>
<tr>
<td>--------------------------</td>
<td>--------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>randomUUID()</td>
<td>Scalar</td>
<td>Returns a string value corresponding to a randomly-generated UUID.</td>
</tr>
<tr>
<td>range()</td>
<td>List</td>
<td>Returns a list comprising all integer values within a specified range.</td>
</tr>
<tr>
<td>reduce()</td>
<td>List</td>
<td>Runs an expression against individual elements of a list, storing the result of the expression in an accumulator.</td>
</tr>
<tr>
<td>relationships()</td>
<td>List</td>
<td>Returns a list containing all the relationships in a path.</td>
</tr>
<tr>
<td>replace()</td>
<td>String</td>
<td>Returns a string in which all occurrences of a specified string in the original string have been replaced by another (specified) string.</td>
</tr>
<tr>
<td>reverse()</td>
<td>List</td>
<td>Returns a list in which the order of all elements in the original list have been reversed.</td>
</tr>
<tr>
<td>reverse()</td>
<td>String</td>
<td>Returns a string in which the order of all characters in the original string have been reversed.</td>
</tr>
<tr>
<td>right()</td>
<td>String</td>
<td>Returns a string containing the specified number of rightmost characters of the original string.</td>
</tr>
<tr>
<td>round()</td>
<td>Numeric</td>
<td>Returns the value of the given number rounded to the nearest integer, with half-way values always rounded up.</td>
</tr>
<tr>
<td>round(), with precision</td>
<td>Numeric</td>
<td>Returns the value of the given number rounded with the specified precision, with half-values always being rounded up.</td>
</tr>
<tr>
<td>round(), with precision and rounding mode</td>
<td>Numeric</td>
<td>Returns the value of the given number rounded with the specified precision and the specified rounding mode.</td>
</tr>
<tr>
<td>rTrim()</td>
<td>String</td>
<td>Returns the original string with trailing whitespace removed.</td>
</tr>
<tr>
<td>sign()</td>
<td>Numeric</td>
<td>Returns the signum of a number: 0 if the number is 0, -1 for any negative number, and 1 for any positive number.</td>
</tr>
<tr>
<td>sin()</td>
<td>Trigonometric</td>
<td>Returns the sine of a number.</td>
</tr>
<tr>
<td>single()</td>
<td>Predicate</td>
<td>Returns true if the predicate holds for exactly one of the elements in a list.</td>
</tr>
<tr>
<td>size()</td>
<td>Scalar</td>
<td>Returns the number of items in a list.</td>
</tr>
<tr>
<td>size() applied to pattern expression</td>
<td>Scalar</td>
<td>Returns the number of paths matching the pattern expression.</td>
</tr>
<tr>
<td>Function</td>
<td>Category</td>
<td>Description</td>
</tr>
<tr>
<td>-------------------------------</td>
<td>------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>size() applied to string</td>
<td>Scalar</td>
<td>Returns the number of Unicode characters in a string.</td>
</tr>
<tr>
<td>split()</td>
<td>String</td>
<td>Returns a list of strings resulting from the splitting of the original string around matches of the given delimiter.</td>
</tr>
<tr>
<td>sqrt()</td>
<td>Logarithmic</td>
<td>Returns the square root of a number.</td>
</tr>
<tr>
<td>startNode()</td>
<td>Scalar</td>
<td>Returns the start node of a relationship.</td>
</tr>
<tr>
<td>stDev()</td>
<td>Aggregating</td>
<td>Returns the standard deviation for the given value over a group for a sample of a population.</td>
</tr>
<tr>
<td>stDevP()</td>
<td>Aggregating</td>
<td>Returns the standard deviation for the given value over a group for an entire population.</td>
</tr>
<tr>
<td>substring()</td>
<td>String</td>
<td>Returns a substring of the original string, beginning with a 0-based index start and length.</td>
</tr>
<tr>
<td>sum()</td>
<td>Aggregating</td>
<td>Returns the sum of a set of numeric values.</td>
</tr>
<tr>
<td>tail()</td>
<td>List</td>
<td>Returns all but the first element in a list.</td>
</tr>
<tr>
<td>tan()</td>
<td>Trigonometric</td>
<td>Returns the tangent of a number.</td>
</tr>
<tr>
<td>time()</td>
<td>Temporal</td>
<td>Returns the current Time.</td>
</tr>
<tr>
<td>time({hour [, minute, ...]})</td>
<td>Temporal</td>
<td>Returns a Time with the specified component values.</td>
</tr>
<tr>
<td>time(string)</td>
<td>Temporal</td>
<td>Returns a Time by parsing a string.</td>
</tr>
<tr>
<td>time({time [, hour, ..., timezone]})</td>
<td>Temporal</td>
<td>Returns a Time from a map of another temporal value's components.</td>
</tr>
<tr>
<td>time.realtime()</td>
<td>Temporal</td>
<td>Returns the current Time using the realtime clock.</td>
</tr>
<tr>
<td>time.statement()</td>
<td>Temporal</td>
<td>Returns the current Time using the statement clock.</td>
</tr>
<tr>
<td>time.transaction()</td>
<td>Temporal</td>
<td>Returns the current Time using the transaction clock.</td>
</tr>
<tr>
<td>time.truncate()</td>
<td>Temporal</td>
<td>Returns a Time obtained by truncating a value at a specific component boundary.</td>
</tr>
<tr>
<td>timestamp()</td>
<td>Scalar</td>
<td>Returns the difference, measured in milliseconds, between the current time and midnight, January 1, 1970 UTC.</td>
</tr>
<tr>
<td>toBoolean()</td>
<td>Scalar</td>
<td>Converts a string value to a boolean value.</td>
</tr>
<tr>
<td>Function</td>
<td>Category</td>
<td>Description</td>
</tr>
<tr>
<td>------------</td>
<td>----------</td>
<td>-------------</td>
</tr>
<tr>
<td>toFloat()</td>
<td>Scalar</td>
<td>Converts an integer or string value to a floating point number.</td>
</tr>
<tr>
<td>toInteger()</td>
<td>Scalar</td>
<td>Converts a floating point or string value to an integer value.</td>
</tr>
<tr>
<td>toLower()</td>
<td>String</td>
<td>Returns the original string in lowercase.</td>
</tr>
<tr>
<td>toString()</td>
<td>String</td>
<td>Converts an integer, float, boolean or temporal (i.e. Date, Time, LocalTime, DateTime, LocalDateTime or Duration) value to a string.</td>
</tr>
<tr>
<td>toUpper()</td>
<td>String</td>
<td>Returns the original string in uppercase.</td>
</tr>
<tr>
<td>trim()</td>
<td>String</td>
<td>Returns the original string with leading and trailing whitespace removed.</td>
</tr>
<tr>
<td>type()</td>
<td>Scalar</td>
<td>Returns the string representation of the relationship type.</td>
</tr>
</tbody>
</table>

29.4. Expressions

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CASE Expression</td>
<td>A generic conditional expression, similar to if/else statements available in other languages.</td>
</tr>
</tbody>
</table>

29.5. Cypher query options

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CYPHER $version query</td>
<td>Version</td>
<td>This will force 'query' to use Neo4j Cypher $version. The default is 4.0.</td>
</tr>
<tr>
<td>CYPHER runtime=interpreted query</td>
<td>Runtime</td>
<td>This will force the query planner to use the interpreted runtime. This is the only option in Neo4j Community Edition.</td>
</tr>
<tr>
<td>CYPHER runtime=slotted query</td>
<td>Runtime</td>
<td>This will cause the query planner to use the slotted runtime. This is only available in Neo4j Enterprise Edition.</td>
</tr>
<tr>
<td>CYPHER runtime=pipelined query</td>
<td>Runtime</td>
<td>This will cause the query planner to use the pipelined runtime if it supports 'query'. This is only available in Neo4j Enterprise Edition.</td>
</tr>
</tbody>
</table>

29.6. Administrative commands

The following commands are only executable against the system database:
<table>
<thead>
<tr>
<th>Command</th>
<th>Admin category</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ALTER CURRENT USER SET PASSWORD FROM ... TO</td>
<td>User and role</td>
<td>Change the password of the user that is currently logged in.</td>
</tr>
<tr>
<td>ALTER USER ... [IF EXISTS] [SET [PLAINTEXT</td>
<td>ENCRYPTED] PASSWORD {password [CHANGE [NOT] REQUIRED]</td>
<td>CHANGE [NOT] REQUIRED}] [SET STATUS {ACTIVE</td>
</tr>
<tr>
<td>CREATE [OR REPLACE] DATABASE ... [IF NOT EXISTS] [OPTIONS {optionKey: optionValue[, ...]}] [WAIT [n [SECOND[S]]]]</td>
<td>Database</td>
<td>Creates a new database.</td>
</tr>
<tr>
<td>CREATE [OR REPLACE] ROLE ... [IF NOT EXISTS] [AS COPY OF]</td>
<td>User and role</td>
<td>Creates new roles.</td>
</tr>
<tr>
<td>CREATE [OR REPLACE] USER ... [IF NOT EXISTS] SET [PLAINTEXT</td>
<td>ENCRYPTED] PASSWORD ... [SET PASSWORD] CHANGE [NOT] REQUIRED] [SET STATUS {ACTIVE</td>
<td>SUSPENDED}] [SET HOME DATABASE name]</td>
</tr>
<tr>
<td>DENY ... ON DATABASE ... TO</td>
<td>Privilege</td>
<td>Denies a database or schema privilege to one or multiple roles.</td>
</tr>
<tr>
<td>DENY ... ON DBMS TO</td>
<td>Privilege</td>
<td>Denies a DBMS privilege to one or multiple roles.</td>
</tr>
<tr>
<td>DENY ... ON GRAPH ... [NODES</td>
<td>RELATIONSHIPS</td>
<td>ELEMENTS] ... TO</td>
</tr>
<tr>
<td>DROP DATABASE ... [IF EXISTS] [DUMP DATA</td>
<td>DESTROY DATA]</td>
<td>Database</td>
</tr>
<tr>
<td>DROP ROLE ... [IF EXISTS]</td>
<td>User and role</td>
<td>Deletes a specified role.</td>
</tr>
<tr>
<td>DROP USER ... [IF EXISTS]</td>
<td>User and role</td>
<td>Deletes a specified user.</td>
</tr>
<tr>
<td>GRANT ... ON DATABASE ... TO</td>
<td>Privilege</td>
<td>Assigns a database or schema privilege to one or multiple roles.</td>
</tr>
<tr>
<td>GRANT ... ON DBMS TO</td>
<td>Privilege</td>
<td>Assigns a DBMS privilege to one or multiple roles.</td>
</tr>
<tr>
<td>GRANT ... ON GRAPH ... [NODES</td>
<td>RELATIONSHIPS</td>
<td>ELEMENTS] ... TO</td>
</tr>
<tr>
<td>GRANT ROLE[S] ... TO</td>
<td>User and role</td>
<td>Assigns one or multiple roles to one or multiple users.</td>
</tr>
<tr>
<td>Command</td>
<td>Admin category</td>
<td>Description</td>
</tr>
<tr>
<td>---------</td>
<td>----------------</td>
<td>-------------</td>
</tr>
<tr>
<td>RENAME ROLE ... [IF EXISTS] TO ...</td>
<td>User and role</td>
<td>Changes the name of a role.</td>
</tr>
<tr>
<td>RENAME USER ... [IF EXISTS] TO ...</td>
<td>User and role</td>
<td>Changes the name of a user.</td>
</tr>
<tr>
<td>REVOKE [GRANT</td>
<td>DENY] ... ON DATABASE ... FROM]</td>
<td>Privilege</td>
</tr>
<tr>
<td>REVOKE [GRANT</td>
<td>DENY] ... ON DBMS FROM]</td>
<td>Privilege</td>
</tr>
<tr>
<td>REVOKE [GRANT</td>
<td>DENY] ... ON GRAPH ... [NODES</td>
<td>RELATIONSHIPS</td>
</tr>
<tr>
<td>REVOKE ROLE[S] ... FROM]</td>
<td>User and role</td>
<td>Removes one or multiple roles from one or multiple users.</td>
</tr>
<tr>
<td>SHOW [ALL</td>
<td>POPULATED] ROLES [WITH USERS]]</td>
<td>User and role</td>
</tr>
<tr>
<td>SHOW DATABASE</td>
<td>Database</td>
<td>Returns information about a specified database.</td>
</tr>
<tr>
<td>SHOW DATABASES</td>
<td>Database</td>
<td>Returns information about all databases.</td>
</tr>
<tr>
<td>SHOW DEFAULT DATABASE</td>
<td>Database</td>
<td>Returns information about the default database.</td>
</tr>
<tr>
<td>SHOW HOME DATABASE</td>
<td>Database</td>
<td>Returns information about the current users home database.</td>
</tr>
<tr>
<td>SHOW [ROLE ...</td>
<td>USER ...</td>
<td>ALL</td>
</tr>
<tr>
<td>SHOW USERS</td>
<td>User and role</td>
<td>Returns information about all users.</td>
</tr>
<tr>
<td>START DATABASE</td>
<td>Database</td>
<td>Starts up a specified database.</td>
</tr>
<tr>
<td>STOP DATABASE</td>
<td>Database</td>
<td>Stops a specified database.</td>
</tr>
</tbody>
</table>

29.7. Privilege Actions

<table>
<thead>
<tr>
<th>Name</th>
<th>Category</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ACCESS</td>
<td>Database</td>
<td>Determines whether a user can access a specific database.</td>
</tr>
<tr>
<td>ALL DATABASE PRIVILEGES</td>
<td>Database and schema</td>
<td>Determines whether a user is allowed to access, create, drop, and list indexes and constraints, create new labels, types and property names on a specific database.</td>
</tr>
<tr>
<td>ALL DBMS PRIVILEGES</td>
<td>DBMS</td>
<td>Determines whether a user is allowed to perform role, user, database and privilege management.</td>
</tr>
<tr>
<td>Name</td>
<td>Category</td>
<td>Description</td>
</tr>
<tr>
<td>-----------------------------</td>
<td>----------</td>
<td>-------------</td>
</tr>
<tr>
<td>ALL GRAPH PRIVILEGES</td>
<td>GRAPH</td>
<td>Determines whether a user is allowed to perform reads and writes.</td>
</tr>
<tr>
<td>ALTER USER</td>
<td>DBMS</td>
<td>Determines whether the user can modify users.</td>
</tr>
<tr>
<td>ASSIGN PRIVILEGE</td>
<td>DBMS</td>
<td>Determines whether the user can assign privileges using the GRANT and DENY commands.</td>
</tr>
<tr>
<td>ASSIGN ROLE</td>
<td>DBMS</td>
<td>Determines whether the user can grant roles.</td>
</tr>
<tr>
<td>CONSTRAINT MANAGEMENT</td>
<td>Schema</td>
<td>Determines whether a user is allowed to create, drop, and list constraints on a specific database.</td>
</tr>
<tr>
<td>CREATE</td>
<td>GRAPH</td>
<td>Determines whether the user can create a new element (node, relationship or both).</td>
</tr>
<tr>
<td>CREATE CONSTRAINT</td>
<td>Schema</td>
<td>Determines whether a user is allowed to create constraints on a specific database.</td>
</tr>
<tr>
<td>CREATE DATABASE</td>
<td>DBMS</td>
<td>Determines whether the user can create new databases.</td>
</tr>
<tr>
<td>CREATE INDEX</td>
<td>Schema</td>
<td>Determines whether a user is allowed to create indexes on a specific database.</td>
</tr>
<tr>
<td>CREATE NEW NODE LABEL</td>
<td>Schema</td>
<td>Determines whether a user is allowed to create new node labels on a specific database.</td>
</tr>
<tr>
<td>CREATE NEW PROPERTY NAME</td>
<td>Schema</td>
<td>Determines whether a user is allowed to create new property names on a specific database.</td>
</tr>
<tr>
<td>CREATE NEW RELATIONSHIP TYPE</td>
<td>Schema</td>
<td>Determines whether a user is allowed to create new relationship types on a specific database.</td>
</tr>
<tr>
<td>CREATE ROLE</td>
<td>DBMS</td>
<td>Determines whether the user can create new roles.</td>
</tr>
<tr>
<td>CREATE USER</td>
<td>DBMS</td>
<td>Determines whether the user can create new users.</td>
</tr>
<tr>
<td>DATABASE MANAGEMENT</td>
<td>DBMS</td>
<td>Determines whether the user can create and delete databases.</td>
</tr>
<tr>
<td>DELETE</td>
<td>GRAPH</td>
<td>Determines whether the user can delete an element (node, relationship or both).</td>
</tr>
<tr>
<td>DROP CONSTRAINT</td>
<td>Schema</td>
<td>Determines whether a user is allowed to drop constraints on a specific database.</td>
</tr>
<tr>
<td>Name</td>
<td>Category</td>
<td>Description</td>
</tr>
<tr>
<td>-----------------------------</td>
<td>------------</td>
<td>--------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>DROP DATABASE</td>
<td>DBMS</td>
<td>Determines whether the user can delete databases.</td>
</tr>
<tr>
<td>DROP INDEX</td>
<td>Schema</td>
<td>Determines whether a user is allowed to drop indexes on a specific database.</td>
</tr>
<tr>
<td>DROP ROLE</td>
<td>DBMS</td>
<td>Determines whether the user can delete roles.</td>
</tr>
<tr>
<td>DROP USER</td>
<td>DBMS</td>
<td>Determines whether the user can delete users.</td>
</tr>
<tr>
<td>EXECUTE ADMIN PROCEDURE</td>
<td>DBMS</td>
<td>Determines whether the user can execute admin procedures.</td>
</tr>
<tr>
<td>EXECUTE BOOSTED FUNCTION</td>
<td>DBMS</td>
<td>Determines whether the user can execute functions with elevated privileges.</td>
</tr>
<tr>
<td>EXECUTE BOOSTED PROCEDURE</td>
<td>DBMS</td>
<td>Determines whether the user can execute procedures with elevated privileges.</td>
</tr>
<tr>
<td>EXECUTE FUNCTION</td>
<td>DBMS</td>
<td>Determines whether the user can execute functions.</td>
</tr>
<tr>
<td>EXECUTE PROCEDURE</td>
<td>DBMS</td>
<td>Determines whether the user can execute procedures.</td>
</tr>
<tr>
<td>INDEX MANAGEMENT</td>
<td>Schema</td>
<td>Determines whether a user is allowed to create, drop, and list indexes on a specific database.</td>
</tr>
<tr>
<td>MATCH</td>
<td>GRAPH</td>
<td>Determines whether the properties of an element (node, relationship or both) can be read and the element can be found and traversed while executing queries on the specified graph.</td>
</tr>
<tr>
<td>MERGE</td>
<td>GRAPH</td>
<td>Determines whether the user can find, read, create and set properties on an element (node, relationship or both).</td>
</tr>
<tr>
<td>NAME MANAGEMENT</td>
<td>Schema</td>
<td>Determines whether a user is allowed to create new labels, types and property names on a specific database.</td>
</tr>
<tr>
<td>PRIVILEGE MANAGEMENT</td>
<td>DBMS</td>
<td>Determines whether the user can show, assign and remove privileges.</td>
</tr>
<tr>
<td>READ</td>
<td>GRAPH</td>
<td>Determines whether the properties of an element (node, relationship or both) can be read while executing queries on the specified graph.</td>
</tr>
<tr>
<td>REMOVE LABEL</td>
<td>GRAPH</td>
<td>Determines whether the user can remove a label from a node using the REMOVE clause.</td>
</tr>
<tr>
<td>Name</td>
<td>Category</td>
<td>Description</td>
</tr>
<tr>
<td>---------------------------</td>
<td>----------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>REMOVE PRIVILEGE</td>
<td>DBMS</td>
<td>Determines whether the user can remove privileges using the REVOKE command.</td>
</tr>
<tr>
<td>REMOVE ROLE</td>
<td>DBMS</td>
<td>Determines whether the user can revoke roles.</td>
</tr>
<tr>
<td>RENAME ROLE</td>
<td>DBMS</td>
<td>Determines whether the user can rename roles.</td>
</tr>
<tr>
<td>RENAME USER</td>
<td>DBMS</td>
<td>Determines whether the user can rename users.</td>
</tr>
<tr>
<td>ROLE MANAGEMENT</td>
<td>DBMS</td>
<td>Determines whether the user can create, drop, grant, revoke and show roles.</td>
</tr>
<tr>
<td>SET LABEL</td>
<td>GRAPH</td>
<td>Determines whether the user can set a label to a node using the SET clause.</td>
</tr>
<tr>
<td>SET PASSWORDS</td>
<td>DBMS</td>
<td>Determines whether the user can modify users' passwords and whether those passwords must be changed upon first login.</td>
</tr>
<tr>
<td>SET PROPERTY</td>
<td>GRAPH</td>
<td>Determines whether the user can set a property to an element (node, relationship or both) using the SET clause.</td>
</tr>
<tr>
<td>SET USER HOME DATABASE</td>
<td>DBMS</td>
<td>Determines whether the user can modify the home database of users.</td>
</tr>
<tr>
<td>SET USER STATUS</td>
<td>DBMS</td>
<td>Determines whether the user can modify the account status of users.</td>
</tr>
<tr>
<td>SHOW CONSTRAINT</td>
<td>Schema</td>
<td>Determines whether the user is allowed to list constraints.</td>
</tr>
<tr>
<td>SHOW INDEX</td>
<td>Schema</td>
<td>Determines whether the user is allowed to list indexes.</td>
</tr>
<tr>
<td>SHOW PRIVILEGE</td>
<td>DBMS</td>
<td>Determines whether the user can get information about privileges assigned to users and roles.</td>
</tr>
<tr>
<td>SHOW ROLE</td>
<td>DBMS</td>
<td>Determines whether the user can get information about existing and assigned roles.</td>
</tr>
<tr>
<td>SHOW TRANSACTION</td>
<td>Database</td>
<td>Determines whether a user is allowed to list transactions and queries.</td>
</tr>
<tr>
<td>SHOW USER</td>
<td>DBMS</td>
<td>Determines whether the user can get information about existing users.</td>
</tr>
<tr>
<td>START</td>
<td>Database</td>
<td>Determines whether a user can start up a specific database.</td>
</tr>
<tr>
<td>Name</td>
<td>Category</td>
<td>Description</td>
</tr>
<tr>
<td>-----------------------------</td>
<td>--------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>STOP</td>
<td>Database</td>
<td>Determines whether a user can stop a specific running database.</td>
</tr>
<tr>
<td>TERMINATE TRANSACTION</td>
<td>Database</td>
<td>Determines whether a user is allowed to end running transactions and queries.</td>
</tr>
<tr>
<td>TRANSACTION MANAGEMENT</td>
<td>Database</td>
<td>Determines whether a user is allowed to list and end running transactions and queries.</td>
</tr>
<tr>
<td>TRAVERSE</td>
<td>GRAPH</td>
<td>Determines whether an element (node, relationship or both) can be found and traversed while executing queries on the specified graph.</td>
</tr>
<tr>
<td>USER MANAGEMENT</td>
<td>DBMS</td>
<td>Determines whether the user can create, drop, modify and show users.</td>
</tr>
<tr>
<td>WRITE</td>
<td>GRAPH</td>
<td>Determines whether the user can execute write operations on the specified graph.</td>
</tr>
</tbody>
</table>
Appendix A: Cypher styleguide

This appendix contains the recommended style when writing Cypher queries.

This appendix contains the following:

- General recommendations
- Indentations and line breaks
- Casing
- Spacing
- Patterns
- Meta characters

The purpose of the styleguide is to make the code as easy to read as possible, and thereby contributing to lower cost of maintenance.

For rules and recommendations for naming of labels, relationship types and properties, please see the Naming rules and recommendations.

A.1. General recommendations

- When using Cypher language constructs in prose, use a monospaced font and follow the styling rules.
- When referring to labels and relationship types, the colon should be included as follows: :Label, :REL_TYPE.
- When referring to functions, use lower camel case and parentheses should be used as follows: shortestPath(). Arguments should normally not be included.
- If you are storing Cypher statements in a separate file, use the file extension .cypher.

A.2. Indentation and line breaks

- Start a new clause on a new line.

Bad

```
MATCH (n) WHERE n.name CONTAINS 's' RETURN n.name
```

Good

```
MATCH (n)
WHERE n.name CONTAINS 's'
RETURN n.name
```

- Indent ON CREATE and ON MATCH with two spaces. Put ON CREATE before ON MATCH if both are present.
Bad

```
MERGE (n) ON CREATE SET n.prop = 0
MERGE (a:A)-[:T]->(b:B)
ON MATCH SET b.name = 'you'
ON CREATE SET a.name = 'me'
RETURN a.prop
```

Good

```
MERGE (n)
  ON CREATE SET n.prop = 0
MERGE (a:A)-[:T]->(b:B)
  ON CREATE SET a.name = 'me'
  ON MATCH SET b.name = 'you'
RETURN a.prop
```

- Start a subquery on a new line after the opening brace, indented with two (additional) spaces. Leave the closing brace on its own line.

Bad

```
MATCH (a:A)
WHERE
  EXISTS { MATCH (a)-->(b:B) WHERE b.prop = $param }
RETURN a.foo
```

Also bad

```
MATCH (a:A)
WHERE EXISTS
  {MATCH (a)-->(b:B)
  WHERE b.prop = $param}
RETURN a.foo
```

Good

```
MATCH (a:A)
WHERE EXISTS {
  MATCH (a)-->(b:B)
  WHERE b.prop = $param
}
RETURN a.foo
```

- Do not break the line if the simplified subquery form is used.

Bad

```
MATCH (a:A)
WHERE EXISTS {
  (a)-->(b:B)
}
RETURN a.prop
```

Good

```
MATCH (a:A)
WHERE EXISTS { (a)-->(b:B) }
RETURN a.prop
```
A.3. Casing

- Write keywords in upper case.

Bad

```
match (p:Person)
  where p.name starts with 'Ma'
return p.name
```

Good

```
MATCH (p:Person)
  WHERE p.name STARTS WITH 'Ma'
RETURN p.name
```

- Write the value `null` in lower case.

Bad

```
WITH NULL AS n1, Null AS n2
RETURN n1 IS NULL AND n2 IS NOT NULL
```

Good

```
WITH null AS n1, null AS n2
RETURN n1 IS NULL AND n2 IS NOT NULL
```

- Write boolean literals (`true` and `false`) in lower case.

Bad

```
WITH TRUE AS b1, False AS b2
RETURN b1 AND b2
```

Good

```
WITH true AS b1, false AS b2
RETURN b1 AND b2
```

- Use camel case, starting with a lower-case character, for:
  - functions
  - properties
  - variables
  - parameters

Bad

```
CREATE (N
  Prop: 0)
WITH RAND() AS Rand, $pArAm AS MAP
RETURN Rand, MAP.property_key, Count(N)
```
A.4. Spacing

- For literal maps:
  - No space between the opening brace and the first key
  - No space between key and colon
  - One space between colon and value
  - No space between value and comma
  - One space between comma and next key
  - No space between the last value and the closing brace

**Bad**

```
WITH { key1: 'value', key2: 42 } AS map
RETURN map
```

**Good**

```
WITH { key1: 'value', key2: 42 } AS map
RETURN map
```

- One space between label/type predicates and property predicates in patterns.

**Bad**

```
MATCH (p:Person{property: -1})-[[:KNOWS {since: 2016}]->( )
RETURN p.name
```

**Good**

```
MATCH (p:Person{property: -1})-[[:KNOWS {since: 2016}]->( )
RETURN p.name
```

- No space in patterns.

**Bad**

```
MATCH (:Person) --> (:Vehicle)
RETURN count(*)
```

**Good**

```
MATCH (:Person)-->(:Vehicle)
RETURN count(*)
```
• Use a wrapping space around operators.

**Bad**

```cypher
MATCH p=(s)-->(e)
WHERE s.name<>e.name
RETURN length(p)
```

**Good**

```cypher
MATCH p = (s)-->(e)
WHERE s.name <> e.name
RETURN length(p)
```

• No space in label predicates.

**Bad**

```cypher
MATCH (person  Person  Owner )
RETURN person.name
```

**Good**

```cypher
MATCH (person:Person:Owner)
RETURN person.name
```

• Use a space after each comma in lists and enumerations.

**Bad**

```cypher
MATCH (),()
WITH ['a','b',3.14] AS list
RETURN list,2,3,4
```

**Good**

```cypher
MATCH (),()
WITH ['a', 'b', 3.14] AS list
RETURN list, 2, 3, 4
```

• No padding space within function call parentheses.

**Bad**

```cypher
RETURN split('original', 'i')
```

**Good**

```cypher
RETURN split('original', 'i')
```

• Use padding space within simple subquery expressions.
Bad

MATCH (a:A)
WHERE EXISTS ((a)-->(b:B))
RETURN a.prop

Good

MATCH (a:A)
WHERE EXISTS ( (a)-->(b:B) )
RETURN a.prop

A.5. Patterns

• When patterns wrap lines, break after arrows, not before.

Bad

MATCH (:Person)-->(vehicle:Car)-->(:Company)
<--(:Country)
RETURN count(vehicle)

Good

MATCH (:Person)-->(vehicle:Car)-->(:Company)<--
(:Country)
RETURN count(vehicle)

• Use anonymous nodes and relationships when the variable would not be used.

Bad

CREATE (a:End {prop: 42}),
(b:End {prop: 3}),
(c:Begin {prop: id(a)})

Good

CREATE (a:End {prop: 42}),
(:End {prop: 3}),
(:Begin {prop: id(a)})

• Chain patterns together to avoid repeating variables.

Bad

MATCH (:Person)-->(vehicle:Car), (vehicle:Car)-->(:Company)
RETURN count(vehicle)

Good

MATCH (:Person)-->(vehicle:Car)-->(:Company)
RETURN count(vehicle)

• Put named nodes before anonymous nodes.
A.6. Meta-characters

- Use single quotes, ' for literal string values.

Bad

```
RETURN "Cypher"
```

Good

```
RETURN 'Cypher'
```

° Disregard this rule for literal strings that contain a single quote character. If the string has both, use the form that creates the fewest escapes. In the case of a tie, prefer single quotes.
### Avoid having to use back-ticks to escape characters and keywords.

**Bad**

```cypher
MATCH (`odd-char@cter$`:`Spaced Label` (`&property` : 42))
RETURN labels(`odd-char@cter$`)
```

**Good**

```cypher
MATCH (node:`NonSpacedLabel` {property : 42})
RETURN labels(node)
```

### Do not use a semicolon at the end of the statement.

**Bad**

```cypher
RETURN 1;
```

**Good**

```cypher
RETURN 1
```

Creative Commons Attribution-NonCommercial-ShareAlike 4.0 International (CC BY-NC-SA 4.0)

You are free to
Share
   copy and redistribute the material in any medium or format

Adapt
   remix, transform, and build upon the material

The licensor cannot revoke these freedoms as long as you follow the license terms.

Under the following terms

Attribution
   You must give appropriate credit, provide a link to the license, and indicate if changes were made. You may do so in any reasonable manner, but not in any way that suggests the licensor endorses you or your use.

NonCommercial
   You may not use the material for commercial purposes.

ShareAlike
   If you remix, transform, or build upon the material, you must distribute your contributions under the same license as the original.

No additional restrictions
   You may not apply legal terms or technological measures that legally restrict others from doing anything the license permits.

Notices

You do not have to comply with the license for elements of the material in the public domain or where your use is permitted by an applicable exception or limitation.

No warranties are given. The license may not give you all of the permissions necessary for your intended use. For example, other rights such as publicity, privacy, or moral rights may limit how you use the material.
